According to an inscription at Chakan dated H. 1071, Shaistekhan repaired the fort in 1663. [Indian Antiquary, II. 352.] Chakan was left in charge of one Uzbek Khan. After Shivaji's surprise of Shaistekhan in Poona city in 1663, Prince Muazzim was appointed viceroy, and the main body of the Moghal army retired leaving strong detachments at Chakan and Junnar. About this time Shivaji, who had gone to Poona to hear a sermon by the great Vani saint Tukaram, narrowly escaped being made prisoner by the garrison of Chakan. [Grant Duff's Marathas, 89, note 1.] In 1667 Shivaji obtained from Aurangzeb the title of Raja and the district of Chakan along with Poona and Supa. [Grant Duff's Marathas, 99.] In 1671 the Moghal general Diler Khan captured Chakan and Lohogad with a large Moghal force. [Grant Duff's Marathas, 110] In 1685 Aurangzeb's rebel son Akbar was intercepted near Chakan and defeated by the Moghal forces. [Scott's Deccan, II.70.] In 1796 Baloba Tatyia seized and imprisoned in Chakan Baburav Phadke the commandant of the Peshwa's household troops. In the 1818 Maratha War, a force under

Lieutenant-Colonel Deacon came before Chakan on the 25th of February 1818, bringing from Poona a detachment of the Bombay European Regiment and some howitzers and guns, the heaviest of them iron and brass twelve-pounders. The garrison made a show of resistance. On the first day one of their guns was disabled, and on the same evening preparations were made for establishing a breaching battery within 250 yards of the western face. The brass twelve-pounders were first brought down to battery early on the 26th to take off collateral defences, and the enemy still continued the fire they had begun on the previous day though with little execution. At the same time a position was given to the 2nd battalion of the 17th Madras Native Infantry and a company of Europeans on the south, while the Nizam's battalion occupied a post on the north. At ten the garrison desired terms; but, as they were asked to lay down their arms, they delayed capitulating till the afternoon when they marched out and grounded. [Blacker's Maratha War, 245; Bombay Courier, 7th March 1818.] In 1827 Captain Clunes mentions Chakan as a market town and fort with 300 houses and seven shops. [Itinerary, 18,]

CHANDKHED.

Cha'ndkhed village twenty miles south-east of Khadkala, with in 1881 a population of 1020, has a fair-weather weekly market on Monday.

CHASKAMAN.

Temple.

Cha'skama'n [This town is called Chaskaman to distinguish it from Chas Narodi fourteen miles north of Khed. Kaman and Narodi are villages adjoining the two towns of Chas.] on the right bank of the Bhima, six miles north-west of Khed, is a market town with in 1881 a population of 2225. Under the Peshwas Chaskaman was a place of importance especially about 1750 when Rakhmabai, the daughter of the second Peshwa Bajirav Ballal (1721 -1740) and the sister of two later Peshwas Balaji and Raghunathrav, married Krishnarav Mahadev Joshi of Chas who was killed at the battle of Panipat (1761). Rakhmabai spent a large sum of money in improving Chas and built a fine flight of steps to the river and a temple of Someshvar Mahadev near the river to the west of the town. The temple is surrounded by a shady quadrangular enclosure whose outer walls have four corner bastions and end in blank petal-shaped battlements. Each battlement of the south and east bastions bears a snake ornament. The chief entrance is the east doorway fronting which inside is a striking lamp-pillar, a curvilinear basalt column ending in an elaborately carved capital with a square abacus. The pillar is lighted on the full-moon of *Kartik* or October-November. The receptacles for the lights, a few of which bear on their front sculptured figures in high relief, are said to number 350. Beyond the lamp-pillar and facing the temple is a deformed bull or Nandi on a raised platform and under a domed canopy. Below the dome and on each of the four sides the canopy has a fine cusped arch slightly ogeed. The temple is oblong and consists of the usual hall and shrine. The hall has three square headed doorways, the north and south doorways having each a grotesquely carved human head as a stepping stone. The shrine is surmounted by a

brick and mortar dome adorned with niches figures and miniature domes. Three small carefully pierced holes in the wall-veil admit light into the shrine.

CHAVAND.

FORT.

Cha'vand is a ruined and dismantled fort ten miles north-west of Junnar and ten miles south-east of the Nana pass. The road from Junnar to Chavand runs through a valley between two ranges of hills one with Hadsar fort stretching to the north-west and the other with the forts of Chavand and Jivdhan running to the southwest. These three forts, and Shivner at the south-east end of the Nana pass valley, effectually guarded the Nana pass and preserved a safe communication between Junnar and the Konkan. The chief strength of Chavand lies in its great natural defences. Its artificial defences, which were weak and incapable of holding out against a hostile force, were all destroyed and the approach to the fort blown up about 1820. Except to hill men the hill is now inaccessible. Near the summit is a deep and narrow precipice which cannot be climbed except with a rope. On the plateau is a small shrine dedicated to the goddess Chavandbai. The water-supply is good but other supplies are scarce. In 1486 Chavand was among the Poona forts which fell to Malik Ahmad the founder of the Ahmadnagar Nizam Shahi family. [Briggs' Ferishta, III. 190.] In 1594 Bahadur the infant son of Burhan Nizam II. (1590-1594) was confined in Chavand for over a year and was then raised to the Ahmadnagar throne. [Briggs' Ferishta, III. 304.] In 1637 Jund or Chavand appears among the Poona forts which Shahaji gave to the Moghals. [Elliot and Dowgon, VII. 60; Grant Duff's Marathas, 53.] In the Maratha war of 1818 a British brigade was sent to take Chavand. The brigade encamped before; Chavand on the 1st of May 1818 and demanded its surrender. The commandant refused to surrender unless directed by his master. A fire of mortars and howitzers was begun in the evening and the bombardment continued till next morning during which about a hundred shells were fired. Then the garrison of upwards of 150 Marathas surrendered unconditionally. They were disarmed and dismissed to their villages. [Pendhari and Maratha War Papers, 294.]

CHINCHVAD.

Chinchvad, a small town in Haveli, with in 1881 a population of 1762, lies about ten miles north-west of Poona, on the right bank of the Pavna which falls into the Mula below the village of Aundh. In 1846 the town is described as looking well from the river side with temples, high' walls, and flights of steps leading to the water's edge. [Lady Falkland's Chow Chow, I. 292.] It is now a market town with a railway station. The 1880 railway returns show 25,355 passengers and 586 tons of goods. Chinchvad is famous as the residence, of a human shrine of the god Ganpati. The story [Trans. Bom. Lit. Soc. III. 69; Murray's Handbook, 178-179. Lord Valentia (Travels, II. 152-158) gives a different version of the story. According to this version, Moroba Gosavi was an inhabitant of Bedar and a pious man. In his youth he was turned out by his father, who found him of no use to the family. In passing Moreshvar or Morgaon near Baramati the youth felt a liking for the god Ganpati and resolved to pay him regular devotion. He proceeded to the then

poorly inhabited village of Chinchvad about fifty miles north-west of Morgaon. From Chinchvad he used to go to Morgaon every day to pay his services to Ganpati. On the fourth of the bright half of *Bhadrapad* or *Ganesh Chaturthi* (August-September) the principal day of the deity's worship Moroba could find no place in the temple to offer his services as it was crowded by the laity of the place and among them the Pingles a wealthy Brahman family. Moroba left his offerings under a tree, but through some miracle the boy's offerings were found in the temple while those of the laity were under the tree. After inquiry the boy was found out and condemned as a sorcerer and forbidden to enter Morgaon on pain of punishment. That night Ganpati appeared in a dream to Pingle and told him that he was extremely offended at his ill-usage of Moroba his favourite devotee. The next day Pingle solicited Moroba to come to the village but Moroba would not. Ganpati thereupon appeared to Moroba in a dream and expressed his wish to stay with him at Chinchvad. The next day Moroba while bathing in the river found the image of Ganpati which is worshipped at Moreshvar. He took it home and built for it a small shrine. It was soon known that Ganpati had taken up his residence with Moroba. He afterwards married and his son was named Chintaman Dev as an incarnation of Ganpati and began to be worshipped as a living god. The Dev whom Lord Valentia visited was the seventh in descent, and was suffering from some disorder in his eyes. Valentia's Travels, II. 152-158.

Mrs. Graham, who visited the living god in May 1809 or seven years after Lord Valentia, describes him as a boy not in any way distinguished from other children except by an anxious wildness of his eyes said to be occasioned by the quantity of opium which he was daily made to swallow. Residence in India, 270.] of the god is that about 250 years ago there lived in Poona a poor but virtuous couple, zealous votaries of Ganpati. They were originally childless, but their great devotion propitiated Ganpati who favoured them with a son whom they named Moroba in honour of the god. Shortly after the birth of Moroba the family removed to Pimple a village about four miles south of Chinchvad. Moroba, who from his youth was studious pious and thoughtful, after the death of his parents removed to Tathvade two miles west of Chinchvad, and from Tathvade used to pay a monthly visit to the shrine of Ganpati at Morgaon about fifty miles south-east of Tathvade. The headman of Morgaon admired his pious life and used to give Moroba a bowl of milk every time he came. It happened once that the headman was gone to work in the fields, and when Moroba called for his milk he found no one in the house but a blind girl whom he told to fetch the bowl. The girl was restored to sight as soon as she touched the threshold of the house where Moroba was. This miracle, and a little later the cure of the then rising Shivaji's eyes, raised Moroba to fame and people flocked to see him. As these visits came in the way of his daily service, Moroba betook himself to a forest which then covered the site of modern Chinchvad. When Moroba grew old loss of strength made it difficult for him to continue his monthly visits to Morgaon. Once he arrived late at Morgaon and found the shrine doors shut. Wearied with fatigue and hunger he lay down and slept. Ganpati appeared to him in a dream, advised him to offer his usual worship, and told him not to trouble to come again to Morgaon, saying, I will live in you and in your children for seven generations, and will fix my residence at Chinchvad. Moroba awoke, found the shrine door open, offered his worship, and retired to rest. In the morning, when the temple ministrants opened the doors of the shrine, they were amazed

to find the image adorned with fresh garlands and found a pearl necklace missing from the image. Search was made and the necklace was found on Moroba's neck, who was sentenced to imprisonment. But by Ganpati's aid Moroba was released and returned to Chinchvad and found in his house a conical stone rising from the ground. Recognising it as his favourite deity he built over it a large temple and soon after buried himself alive sitting with a holy book in his hand. He left strict orders that his grave should not be opened. Moroba's son Chintaman was the second living god. He once assumed the form of Ganpati to satisfy the jealousy of the great Vani poet Tukaram who prided himself on Vithoba's coming to dine with him. Tukaram called Chintaman by the surname of god or *dev* and, this surname has passed to his descendants. Chintaman died a natural death and was succeeded by Narayan the third *dev*, who is said to have changed into a bunch of jessamin flowers a dish of beef which Aurangzeb (1658-1707) sent him to test his godhood. Aurangzeb was so pleased with the miracle that he is said to have made the Dev family an hereditary grant of eight villages. The fourth *dev* was Chintaman II. the son of Narayan. The fifth *dev* was Dharmadhar, the sixth Chintaman III., and the seventh Narayan II. The last *dev* drew upon himself a curse which ruined the family. An idle curiosity led him to open the grave of Moroba, who, disturbed in his meditations, told him that the godhood would end with his son. Narayan II.'s son Dharmadhar II. died childless in 1810, and with him ended the seventh generation of the *dev* family. A boy named Sakhari a distant relation of the deceased was set up in his place by the priesthood to preserve the valuable grants to the temple. The only miracle which the god is believed to have still the power of working is that at the yearly entertainments given to Brahmans at Chinchvad, however limited the provisions for the guests, there is never either too much or too little, but enough for guests however numerous.

The Dev family lives in a mansion on the river built partly by Nana Fadnavis (1764 - 1800) and partly by Hari Pant Fadke a famous Maratha general (1780 - 1800). [Valentia's Travels, 11.152158.] Near the palace stand temples each sacred to one of the departed Devs. The chief temple is dedicated to Moroba. It is a low plain building (30' x 20' x 40') with a square hall or *mandap* and an octagonal shrine. On the wall of the inner shrine is a Marathi inscription in Devnagari letters which may be translated:

This temple was begun on the bright twelfth of *Kartik* (November-December) *Shak* 1580 (A.D. 1658-59) *Vilambi Samvatsara* and finished on Monday the bright fourth of *A'shadha*, *Vikari Samvatsara*.

On the outer wall of the temple of Shri Narayan, the third *dev* or human-Ganpati shrine, is another inscription in Marathi which may be translated.

Begun on the bright tenth of the month of *Kartik* (November-December) *Shak* 1641 (A.D. 1719-20) *Vikari Samvatsara* and finished on the bright third of *Vaishakh* (April-May) *Shak* 1642 (ID. 1720-21) *Chitrabhanu Samvatsara*.

The temples enjoy a yearly grant of £1380 (Its. 13,800) being the revenue of eight villages. [The eight villages with their revenues are Banere Rs. 773; Chikhli Rs. 2323; Chinchvad Rs. 1369; Man Rs. 1922; Charoli Budrukhs Rs. 3570; Chincholi Rs. 677; and

Bhosari Rs. 3169. All are in the Poona district. Mr. Norman, Collector of Poona, 1879.] A yearly fair attended by about 2000 persons is held here in honour of Ganpati on the sixth day of the dark half of *Margshirsh* or December-January and lasts three days.

DAHOLI.

Da'holi in Maval a small *inam* village about twelve miles north- west of Khadkala, with in 1881 a population of 321, has a temple of Mahalakshmi enjoying a yearly cash allowance of £3 4s. (Rs. 32) of which £3 (Rs. 30) are paid by the proprietor of Daholi. A fair attended by about 2000 people is held on the full-moon of *Paush* or December-January.

DAPURI.

Da'puri, a village of 730 people in Haveli, on a roughly semi-circular plot of land surrounded by the windings of the Mula, on the left bank of the river, lies on the Bombay-Poona road two miles north of Kirkee and six miles north of Poona. The chief objects of interest at Dapuri are several bungalows and gardens on the Pavna a tributary of the Mula, the first bungalow built about 1820 by Captain afterwards Colonel Ford, C. B. at a cost of about £11,000(Rs.1,10,000). Captain Ford had long been the assistant of Sir Barry Close, the Poona Resident, and, in 1812, by his interest was appointed to raise and command a brigade of troops, disciplined after the English fashion for Bajirav Peshwa. The new levies were not cantoned at Dapuri till 1817. On the 5th of November of that year, in spite of the Peshwa's threats, the brigade joined Colonel Burr's army and took a prominent part in the battle of Kirkee. [Details are given below under Poona Objects, Kirkee.] It was the declared intention of Bajirav to spare Major Ford if he had succeeded. [Major Ford was a great favourite of the Peshwa. There is a romantic story of an understanding between Major Ford and Moro Dikshit the Peshwa's general. Moro Dikshit knew that they must take different sides in the battle of Kirkee and that probably one of them would die. An agreement was made, as proposed by Major Ford, that the survivor should maintain the family of the deceased. Moro Dikshit fell and Major Ford is said to have kept his word. Grant Duff's Marathas, 650-651.]

During his residence at Dapuri Major Ford was very hospitable. His house was open to all strangers and his table was maintained in a princely style. He was a liberal supporter of charities and was perhaps as greatly beloved and respected by the natives as any European who ever visited India. Soon after the victory of Kirkee Major Ford, who had attained his Lieutenant-Colonelcy, was attacked with fever and died in Bombay. His beautiful residence was bought for Government by Sir John Malcolm in 1828 at £1000 (Its. 10,000), and was used for the rainy season (June-October) residence of the Governor till 1865 when the new Government House at Ganeshkhind was completed. [Murray's Bombay Handbook, 182.] The buildings, now all out of repair, consist of a large main bungalow the old Government House, with reception rooms and a ball room eighty feet long, [Lady Falkland gives an interesting account of a Government House ball in this room about 1850. Chow Chow, I.228.] a bungalow with bed rooms, an office bungalow on the river side, a set of quarters for aides-de-camp and officers of the bodyguard, and

two bungalows for the Garden Superintendent and head gardener. Besides the bungalows there are large horse and cattle stables, servants' lines, and store rooms built at a cost of above £50,000 (Its. 5 lakhs). Of the total 71 ½ acres of land eleven acres are unarable, 12½ are occupied by buildings, and forty-eight acres formed the botanical gardens which Sir John Malcolm established about 1828 at a yearly cost of £360 (Rs. 3600) to introduce useful exotics. The gardens were at first under Mr. Williamson who soon died and was succeeded by Dr. Lash and Dr. Gibson. Dr. Gibson established, in connection with the botanical gardens, nurseries at Hivre Nirgori and Shivner' fort in Junnar. The chief experiments were in the cultivation of foreign cottons, coffee, tea, tobacco, Mauritius sugarcane, the mulberry, the cochineal insect, culinary vegetables, and fruit trees. During the American war (1863-1865) Government sold the estate by auction and Government house was removed to Ganeshkhind where new botanical gardens were made. The auction realized £21,000 (Rs. 2,40,000) and the property went to a company of three partners two Europeans and a native who managed it apparently more as a private residence than for profit until they became bankrupts, and mortgaged the estate to Messrs. Fell and Co. of Poona. The mortgage appears to have been foreclosed and, in 1874-75, the estate was sold to a Parsi gentleman Mr. Mervanji Shot for £3500 (Rs. 35,000) who spent £700 (Rs. 7000) in repairs to the bungalows. All the bungalows are now unoccupied, as the situation, about a mile from Kirkee railway station and 400 yards from the railway, makes it inconvenient for private residence. The last owner was a minor, and during his minority many of the best and most valuable trees have been cut down for £200 (Rs. 2000) leaving now a mango grove and a large number of exotic and indigenous trees. The land, which the owner held free of all rent and charges even of *balutas* to the village servants, had been leased yearly for about £35 (Rs. 350; including the produce of fruit trees" but subject to a monthly charge of 16s. (Rs. 8) for a watchman. The estate has been bought by Messrs. Meakin & Co. who intend to establish a brewery here. [Mr. E. C. Ozanne. C. S.; Mr. J. G. Moore, C. S.]

DEHU.

Dehu in Haveli, on the right or south bank of the Indrayani a feeder of the Bhima, is a large alienated village of 1498 people about thirty miles north-west of Poona and about three miles north of Shelarvadi station on the Peninsula railway. Dehu was the birthplace of Tukaram a Vaishya Vani by caste, the famous devotee of Vithoba of Pandharpur and one of the greatest of Maratha poets (1608-1649). The poet's spirit is supposed still to live in the Shri Tukaramdev's temple at Dehu, where a yearly fair lasting for four days and attended by about 3000 people is held in his honour on the dark second of *Phalgun* or March. Dehu has also a temple of Vithoba where about 1000 people come on the bright and dark eleventh of every Hindu month to pay their devotions to the god.

DHAMANKHED.

Dha'mankhed, a small village three miles south of Junnar, with in 1881 a population of 212, has two fairs in honour of Khandoba, on the full-moons of *Magh* or January - February and of *Chaitra* or March-April each attended by about 2000 people. The temple

enjoys a yearly Government allowance of £3 10s. (Rs. 35) in cash and rent-free land assessed at about £2 10s. (Rs. 25).

DHOND.

Dhond in Bhimthadi, on the left bank of the Bhima eight miles north-east of Patas and about forty-eight miles east of Poona, is a large market town, with in 1881 a population of 3486. Dhond is the junction of the Dhond-Manmad State Railway with the southeast branch of the Peninsula railway. Besides two railway stations, Dhond has a post office, a travellers' bungalow, a rest-house, two temples, and a mosque. The weekly market is held on Sundays. The railway returns show 188,697 passengers and 3405 tons of goods for 1883 at the Peninsula station and 125,846 passengers and 4892 tons of goods for 1880 at the Dhond and Manmad railway station. It is worthy of note that the opening of the Dhond-Manmad line has lowered Dhond from one of the largest to one of the smallest goods stations within Poona limits. The reason is that the traffic of the whole country which is tapped by the southern stations on the Dhond-Manmad line was formerly forced to Dhond. It is this fall in the Dhond returns which causes the apparent decline in goods traffic at the Poona district stations between 1871 and 1882 which is noticed but is not explained in the Trade Chapter. [See Part II. pp. 170- 173.] The two temples in Dhond are of Bhairavdev and Vithoba both said to have been built by Mahadji Sindia (1760-1794) to whom the village was granted. The Bhairavdev temple is built of stone with a brick superstructure. A yearly fair is held here in April.

DIKSAL.

Diksal, a small village about twenty miles north-west of Indapur. within 1881 a. population of 483, has a post office and a station on the Peninsula railway 6¼miles south-east of Poona. The 1883 railway returns showed 31,531 passengers and 7974 tons of goods.

GARODI HILL.

Caves.

Garodi Hill, about ten miles south of Talegaon-Dabhade, has, at 450 to 500 feet above the plain, a few early Buddhist caves of about the beginning of the Christian era. The first cave, which is high up in the scarp and now almost out of reach, faces south-west by west. It consisted apparently of a single cell of which the front has fallen away. The second cave is a little lower and includes a vestibule (29'x 9' 9"x8'8") with four cells at the back. Between each pair of doors are two pillars attached to the wall, half octagons with water-pot bases and animal capitals with elephants lions or tigers over each. The capitals support a projecting frieze of the rail pattern. Along the ends and back, under the pillars, runs a bench two feet broad by one foot and seven inches high. The cells within are plain. The cave has been Brahmanised and in the third cell from the left is a *ling* with a small bull or Nandi in the vestibule and a lamp-pillar and *tulsi* altar outside. On the side

post of the cell door a short roughly cut inscription records the visit of a devotee and is dated 1439 (S. 1361, *Siddharthi Samvatsar*) the bright half of *Shravan* or July-August.

North-west at some distance from the second cave is a dry cistern, and still further along is a small cave that has apparently had a wooden front with four upright posts fitting into sockets in the rock above. In the left end is a recess and in the back a door leading into a cell. A few yards beyond is a rock-cut well and near the well is the fourth cave. The front of this fourth cave is entirely gone. To form a new front a thick wall has been built a few feet farther in than the original with two round-arched doors. The hall has four cells on the right, two in the back besides a shrine recess and three on the left, a fourth being entirely ruined. In the shrine recess was a relic shrine or *daghoba*, its capital as in the Kuda caves being attached to the roof. The relic shrine has been cut away to make room for a small low Shaiv altar or *chaurang*. Over the fourth cave to the left is a cell, on the left end of the front wall of which is an inscription in Andhra or Deccan Pali letters (A.D. 100). The inscription, which is cut in five lines on a surface full of holes and flaws, may be translated:

To the perfect one. The charitable gift of a dwelling cave or *lena* by Siagutanika, wife of Usabhanak', a Kunbi (by caste) and ploughman, living in Dhenuka-kada with her son Nanda a householder, with (?)

Crossing the ridge which joins the hill with another to the west of it are two other small caves, both monks' cells of no note and difficult to reach. [Fergusson and Burgess Cave Temples, 246-247; Separate Pamphlet, Archaeological Survey No. X. 38.]

GHODE.

Ghode on the Ghod, about twenty-five miles north of Khed, is the head-quarters of the Ambegaon petty division in Khed, with in 1872 a population of 4923 and in 1881 of 4893. A weekly market is held on Friday. Besides the petty divisional revenue and police offices Ghode has a school, a post office, and an old mosque. The mosque is rude and massive and has a three-arched front with two minarets one at each corner of the entablature. Two plain and massive onestone pillars support the arches. On each pillar a Persian inscription records that the mosque was built about 1580 by one Mir Muhammad. In 1839 a band of Kolis threatened the petty divisional treasury at Ghode. Mr. Rose, assistant collector, gathered a force of messengers and townspeople and successfully resisted the repeated attacks of 150 insurgents who besieged them the whole night. [See Part II. 307.]

GHOTAVDE

Ghotavde village, fifteen miles north-west of Poona, with in 1881 a population of 2193, has a weekly market on Tuesday.

HADSAR FORT.

Hadsar Fort rises on a steep hill near the Nana pass valley eight miles north-west of Junnar and sixty miles north of Poona. The fort lies within the limits of Hadsar village at the foot of the fort. From Junnar the road to the hill lies along the valley of the Kukdi between two ranges of high hills. The road is easy and passable even for carts, but five miles from Junnar it is crossed by the Kukdi which during the rains is difficult to ford. The approach to the fort lies over a steep ravine guarded by an embrasured and loopholed wall twenty yards long, thrown between the fort and a small hill to the west which is 700 yards round. The approach near the top, a rock-cut staircase sixty-five yards long, leads to two rock-cut gateways without doors. The hill, which is about 3200 yards round, rises about 1000 feet above the Junnar plain. It is surmounted by a steep natural scarp 150 to 200 feet high. On this scarp stands the fort in shape a triangle with two equal sides. Only the wall that joins the fort with the neighbouring hill is seen from below. Except by the two rock-cut gateways the fort has no entrance. Inside are a few ruins, the commandant's office or *kacheri*, and a small temple. On the west a rock-cut passage leads to three underground chambers which are used as storerooms, one of them being filled with water. The water-supply is from several cisterns inside the fort.

History.

Hadsar was one of the five Poona forts which Shahaji gave to the Moghals in 1637. [Elliot and Dowson, VII. 60; Grant Duffs Marathas, 53.] It fell to the British in 1818 soon after the fall of Junnar (25th April 1818). The commandant of Junnar, hearing that the English were marching on Junnar, left the town and fled to Hadsar. Major Eldridge learning of the flight to Hadsar sent a small detachment under Major M'Leod which reduced Hadsar and captured the fugitive commandant with twenty-five horses and four camels. [Pendhari and Maratha War Papers, 293-294; Bombay Courier, 16th May 1818. A correspondent of the Courier mentions Hadsar fort as deserving of notice, apart from its natural strength, from the labour spent on its two gates and its entire rock-cut passage. The gates with the connecting passage were entirely rock-cut and had not a foot of masonry about them. ' You enter the side of the mountain, go up a passage, and through another gate to the hill, and then get into the interior of the fort as if you were entering a well.' Ditto.]

[HINGNE KHURD.](#)

Hingne Khurd is a small village on the Mutha about four miles south-west of Poona, with in 1881 a population of 121. The village has a modern temple of Vithoba with steps leading to the river-bed where a large fair is held twice a year in June-July and in October-November. The temple, which is of stone and brick, was built by Shivaji, and has since been repaired and added to by a rich Poona contractor of the Gavandi or mason caste named Bhau Mansaram. The temple (50' x 15') includes a shrine and two halls and is enclosed by a stone wall. The fair called Viththalvadi is held on the bright eleventh of *Kartik* or October -November and *Ashadh* or June-July. About 25,000 people attend each fair and sweetmeats and toys are sold in large quantities. The Khadakvasla canal flows behind and not far from the temple.

HIVRE BUDRUKH.

Hivre Budruk, a small village eight miles east of Junnar, with in 1881 a population of 1160, has, to its west, a tomb of Pir Lalkhan, where a yearly fair or *urus* is held on the dark third of *Chaitra* or March-April attended by about 5000 people. The tomb enjoys a yearly Government grant of 123. (Rs. 6).

INDAPUR.

Inda'pur, north latitude 18° 8' and east longitude 75° 5', on the Poona-Sholapur road about eighty miles south-east of Poona, is a municipal town, the head-quarters of the Indapur sub-division, with in 1872 a population of 7740 and in 1881 of 4242. The great fall in the population is due to the famine of 1876-77 during which Indapur and the country round suffered severely. Besides the sub-divisional revenue and police offices Indapur has a municipality, dispensary, anglo-vernacular school, travellers' bungalow, a weekly Sunday market, and a considerable manufacture of country cloth. The municipality was established in 1865 and had in 1882-83 an income of £191 (Rs. 1910) and an expenditure of £189 (Rs. 1890). The dispensary was established in 1870 and in 1883 treated six in-patients and 5300 out-patients at a cost of £83 8s. (Rs. 834). A yearly fair is held in November-December in honour of a Musalman saint Chand Khan.

The earliest reference to Indapur is in 1486 when it is mentioned as belonging to the first Bijapur king Yusuf Adil Shah. Zain-ud-din, the commandant of Chakan fort, had revolted and asked the help of Yusuf who sent 6000 horse which he ordered to encamp near the fort of Indapur. [Briggs' Ferishta, II. 530.] About 1640 Indapur with Baramati was included in the territory of Shahaji the father of Shivaji. [Grant Duff's Marathas, 56.] In 1707 Aurangzeb conferred Indapur and Supa on Shahu. [Grant Duff's Marathas, 184.] In a revenue statement of about 1790 Indapur appears as the head of a *pargana* in the Junnar *sarkar* with a revenue of £10,890 (Rs. 1,08,900) [Waring's Marathas, 240.]. In 1828 Indapur is noticed as once a place of importance. Its trade was fallen and it had no manufactures but the weaving of coarse cloth for the local markets. [Mr. Pringle in Lithographed Papers, 6-9-28. In 1827 Captain Clunes (Itinerary, 271 notices Indapur as a *kasba* or market town with 1500 houses, a water-course, and wells.]

INDORI.

Indori in Maval, an alienated village on the left, bank of the Indrayani ten miles east of Khadkala, with in 1881 a population of 990, has a bastioned fort picturesquely placed on a steep bank washed by the Indrayani. The village is held in *inam* by the Dabhade family of Talegaon.

JEJURI.

Jejuri, [Contributed by Mr. J. McL. Campbell, C. S.] a station on the West Deccan railway, on the old Poona Satara road about ten miles south-east of Sasvad, is a famous place of pilgrimage, with in 1881 a population of 3245. Jejuri has a school, a post office,

and a police station. The railway station is expected to be opened in 1885. A municipality was established in 1868 to carry out sanitary arrangements during the religious fairs to which the village owes its importance. These fairs are in honour of the god Khandoba, who is also called Bahiroba, Malhari, and Martand. Khandoba has two temples at Jejuri, both built at the end of an outlying spur of the Purandhar range which here sinks into the plain. The larger and more modern temple stands close to and about 250 feet above the village. The older temple is built on a small plateau called Karepathar two miles off about 400 feet higher. The old village site now deserted was to the east of the hill, on which the lower temple stands. The modern village includes two wards or *peths*, Budhvar to the north of the temple hill and Aditvar to the west of Budhvar. Close to the south of the old village site is a reservoir, thirty-seven acres in area, built by the last Peshwa Bajirav II. (1796-1817) and called after him the Peshwa's reservoir. It is round and encircled with a massive stone wall in good preservation. The water which is used for crop-watering is drawn off through an elaborate mass of masonry. Stairs lead to sluices which draw the water off at different levels. The reservoir has several small bathing cisterns or *hauds* and a shrine of Ganpati. In the low ground beyond the Peshwa's reservoir, and fed by soakage from it, is a well or spring called Malhar Tirth or Malhar's Pool bathing in which forms part of the pilgrimage ceremonial. On the north-west of the new village a square stone reservoir, of about twenty acres, was built about 1770 by Tukoji Holkar. As it is on a higher level than the village, its waters are drawn off in covered channels to feed dipping wells built by the municipality at various points in the village.

Between this reservoir and the village stands a temple to Mahadev built in memory of Malharav Holkar. The chief object of worship is a *ling* behind which are statues of Malharav and his three wives Banabai, Dvarkabai, and Gotamabai, all in Jaipur alabaster.

Khandoba's Temple.

Three flights of steps on the east, west, and north lead to Khandoba's temple. The east and west steps, which are simple flights, are little used, the main approach to the temple being on the north. This approach is spanned by several arches and flanked by numerous shrines and lamp-pillars. [According to a saying this approach has eighteen arches, 350 lamp-pillars, and 900,000 steps. The number of the steps is admitted to be a fancy number, but the total of the arches and of the pillars is said to be correct.] At about a third of the way up, the flight of steps divides into two branches which join again about fifty feet higher. At the meeting pilgrims visit the shrine of Khandoba's ministers, Hegadi a Dhangar and Pradhan a Vani, on the way up, and the shrine of Khandoba's second wife Banal on the way down. Both of these shrines are on the right hand. The votive images of sheep and other cattle offered by pilgrims are placed in front of Banai's shrine who was a Dhangar the sister of Hegadi. As Mhalsa, Khandoba's first wife, was jealous of Banai, Khandoba, to preserve peace, placed Mhalsa on the top of the hill and Banai near the foot. The stairs lead up the hill to a fort-like enclosure, oblong, eight-sided, and 350 yards round. Above a high plinth of plain masonry a colonnade or open cloister runs round the hill top and encloses a paved court in the middle of which stands the temple of Khandoba. Outside and near the gate is a hole in the wall venerated on account of a

miracle by which the god saved the Jejuri temple from the Musalmans when the fine temple of Bhuleshvar, about fifteen miles to the north, was wrecked. The story is that as the Musalmans were beginning to break the carved work a swarm of hornets came out of the hole, put them to flight, and so convinced them of the power of the god that they gave up the attempt to harm the temple. Aurangzeb (1658-1707), to show his respect for the god, is said to have presented the temple with a diamond worth £12,500 (Rs. 1¼ lakhs). The diamond remained in the temple till 1850-51 when it was robbed by Kolis and temple servants.

In front of the court-yard, raised a few inches from the level of the pavement, is the representation of a tortoise almost circular in outline and about twenty feet in diameter. A few years ago the tortoise was plated with brass at the expense of some Konkan fishermen. Beyond the tortoise is the lower part of the mast formerly used in hook swingings. Beyond the mast and facing the temple is the giant Malla, a huge nine feet stone image painted red and leaning against one of the pillars of the cloister. In the temple porch hang two bells, one of them Portuguese with the inscription 1711 N. S. Dasangust, that is Our Lady of Troubles. According to one of the oldest of the temple servants this bell was brought in his youth or fifty years ago by a Bombay Mali or gardener. It probably has the same history as the large Bhimashankar bell which is one of the spoils of Bassein. The other bell has an undated Marathi inscription, saying it is the gift of two worshippers of Shiv. A clumsy sword with a blade four feet long and four inches broad, kept in the porch, is said to have belonged to the demon Malla.

Besides this porch the temple consists of a square hall with an inscription dated A.D. 1675 (*Shak* 1597). Behind the hall under the spire is a dark chamber. In this dark chamber behind a *ling* stand three pairs of images of Martand or Khanderav and Mhalsa. One pair in gold is a present from the Povar family, a pair in silver is from one of the Peshwas, and the old pair is in stone. The temple is of cut-stone and the spire is of stucco ornamented with figures of gods and other devices. An inscription in the inner hall bears a date corresponding to A.D. 1675 (*Shak* 1597) and another on the inner threshold is dated A.D. 1381 (*Shak* 1303). Behind are a temple of Shiv called the Panchling temple and built in 1755 by Vithalrav Dev Sasvadkar of the Vinchurkar family, and a chamber for the distribution of yellow powder built in 1754 by Devaji Chaudhari of Shrigonda in Ahmadnagar. In the section of the surrounding corridor or cloister behind, or to the west of, these temples is the shapeless stone representing Mhalsa, the first or Lingayat Vani wife of Khandoba. Inscriptions show that this part of the encircling corridor was built in 1742 by Malharav Khandoji Holkar who also built other parts of it between 1737 and 1756. The corridor was completed in 1770 by Tukoji Malharav Holkar. The flat roof of the corridor commands on the south and west a good view of the Purandhar range and the spurs stretching from it into the flat Deccan; while to the north and east lie the plains of Sasvad and Supa.

Upper Temple.

The plateau of Karepathar is 11½ acres in extent, and, besides a temple of Khandoba older and more sacred than the one near the village, contains several other temples and

shrines and thirteen houses occupied by priests and temple servants. None of these buildings have any architectural interest.

Sacred Spots.

On the profile of the spur between the upper and lower temples several sacred spots are marked by shrines and arches. At one point is an indentation in the rock said to have been caused by the foot of Khandoba's horse. The legend is that some Brahmans living near Jejuri were attacked and their property carried off by a demon called Manimal Malla or Mallasur. In answer to the prayers of the Brahmans Shiv appeared as the warrior Khandoba and slew the demon. Before his death Malla was converted to Shaivism and both he and Khandoba were absorbed into Shiv. In acknowledgment of Malla's conversion obeisance is made to the large stone image of Malla which stands in the courtyard of Khandoba's temple.

Festivals.

The chief festivals are four all between December and April. The earliest is from the bright fourth to the bright seventh of *Margashirsh* or November-December, the next from the bright twelfth to the dark first of *Paush* or December, January, the third from the bright twelfth to the dark first of *Magh* or January - February, and the fourth and last is from the bright twelfth to the dark first of *Chaitra* or March, April. These four are large fairs attended by pilgrims from as far as Khandesh, Berar, and the Konkan.

Somvati Amavasya.

Two smaller festivals as a rule are attended only by people from the immediate neighbourhood on Somvati Amavasya or the no-moon Monday whenever it comes and Dasra the bright tenth of *Ashvin* or September-October. On the no-moon Monday the god is taken in procession for a bath. He is carried in a palanquin to a temple of Devi on the Karha in the lands of Mauje Dhalevadi two miles north of Jejuri, where he is bathed in the river and carried back to the temple. From 500 to 1000 people from the neighbouring villages attend this ceremony.

Dasra.

At Dasra in September-October a palanquin procession starts from the temple near the town and at the same time another palanquin procession starts from the temple on Karepathar. They march towards each other on the hill side, halt when the processions have almost met, and after a short interval each returns to the temple from which it started. The processions are joined by crowds from the neighbouring villages but not by the distant pilgrims. In former days one of the ceremonies performed at Jejuri was that on the bright sixth of *Margashirsh* or November-December one of the *vaghyas* or men devoted to the temple was required to run a sword through his thigh. The bloody sword was laid before the god and the man had to walk through the town in spite of his wound. In those days hookswinging was practised at all the fairs chiefly by women. The usual

vows now are to build steps in the ascents to the temples, to make cash gifts to the temples, to distribute cocoa-kernel and turmeric in front of the temple, to kill and eat a sheep in honour of the god, to feed Brahmans, and to devote to the god male children or *vaghyas*, and female children or *murlis*. [Of Vaghyas and Murlis details are given in the Population chapter, Part I. pp. 476-477.] The number of persons thus devoted to the god is considerable.

Pilgrims.

Many of them live at Jejuri, where, at festivals, they are hired by pilgrims to sing and dance in honour of the god. Others live in the surrounding villages, and many wander and beg in bands. The worshippers are chiefly Marathas, who come from all the Surrounding districts and even from greater distances. The most important of the pilgrims are the Marathas from Khandesh and Berar, large bands of whom attend the fairs every year. The Berar Marathas attend the *Paush* or December-January fair. Pilgrims from several villages come in large bands for mutual protection a relic of old unsettled times. Pilgrims also come from Khandesh chiefly in *Margashirsh* or November-December, *Paush* or December-January, and *Magh* or January - February; they do not come in *Chaitra* or March-April. Like the Berar pilgrims they come in large bands. The fishing Kolis from the sea coast are also worshippers of Khandoba and come, occasionally in large numbers but they do not attend as regularly as the pilgrims from Khandesh and Berar. When they do come Konkan Kolis attend the *Magh* or January-February fair. The Kolis have a *bhagat* who has a palanquin, of Khandoba. The *bhagat* consults omens, and unless they are favourable the fishermen do not make the pilgrimage. In January and February each band of pilgrims brings with it a gay red or red and yellow banner on a tall staff. On the dark first these banners are carried in procession up to the temple; There the bearers stand on the brass tortoise in front of the temple and hold the long banner poles aloft pointing them towards the pinnacle of the temple. They then ascend the hill with their banners which they carefully carry back with them to their villages.

The pilgrims chiefly lodge with the Guravs who have seventy-five houses or with Brahmans who have seventy-five to eighty houses in Jejuri. Other pilgrims camp in a fine grove beside Holkar's reservoir or in the open fields to the north, north-west and north-east of the village. Dotted over the fields and clestering round the lofty pole from which flies a gay banner, the camps have a picturesque effect.

On the day of his arrival the pilgrim takes a dust-glimpse or *dhul darshan* of the god and lays before him a cocoanut and $\frac{3}{4}d$. ($\frac{1}{4}$ a.). The pilgrim must repeat his visit to the god at least once during every day of his stay in Jejuri, and each time that he enters the temple gate he pays $\frac{3}{4}d$ ($\frac{1}{2}$ a.) as municipal pilgrim tax. On the second day the pilgrim pays his vow. If the vow is to feed Brahman; the catering is usually done by contract by the Brahman or Gurav at whose house the pilgrim is lodging at the rate of $8d$. ($5\frac{1}{3}$ as.) a head. When a feast is given to Brahmans one: man's portion must be taken to the temple by the pilgrim. He lays; it before the god and it becomes a perquisite of the temple Guravs. If the vow is to offer a sheep it is killed on payment of $1\frac{1}{2}d$ (1 a.) ahead, half of which goes to the municipality and half to the *Mulla* who kills the sheep. Then at his

camp or lodging the flesh is eaten by the pilgrim and his party who must be joined in their meal by some of the *vaghyas* and *murlis* or men and women devoted to the temple. After the meal is over the party go to pay their respects to Banai, Khandoba's Dhangar wife, and the guardian of his flocks and herds. On the evening of this day the pilgrims provide themselves with torches and oil vessels, and, with lighted Torches, proceed in large bodies to climb the hill. On reaching the top they pay their respects to the god, wave their torches in front of the temple, walk round the battlements of the encircling corridor, and go down to their camps. From a distance the effect of the irregular lines of twinkling lights moving up and down the flights of stairs and appearing, now many and now few, on the battlements is striking.

On visiting the temple every pilgrim stands on the brass tortoise and throws into the air handfuls of chopped cocoa-kernel mixed with turmeric to be scrambled for by the temple servants and hangers-on. The pilgrim keeps some pieces to carry home with him as the god's favour or *prasad*, a charm to bring a blessing. A favourite form of worship is to pour over the sacred *ling* the five nectars or *panchamrit* a mixture of milk, curd, sugar, honey, and clarified butter.

After the torch-light procession is over, pilgrims who have made vows to offer music and dancing to the god, hire bands of *Vaghyas* and *Murlis* to come to their lodgings or camps and there sing play and dance in honour of the god. The fee for a band of dancers and musicians is 2s. 6d. (Rs. 1¼).

Pilgrims who are strong enough to climb to the Karepathar or old temple spend their third day at Jejuri in visiting the old temple. They bathe at the Malhar *tirth*, the well or spring beyond the Peshwa's pond; they then climb to the Karepathar, and, after paying their respects to the god, come back to the village by a different path from that by which they climbed. Then they do their shopping, which, except a little trade in blankets, is of no importance. The things usually bought by pilgrims about to leave are pulse and parched gram to eat by the way, coats and caps as presents for their children, and small brass vessels and images of the god as tokens of the pilgrimage. When pilgrims, who have lodged with Brahmans or Guravs, are about to start on their return home they make presents to their hosts according to their means. The hosts in return give the pilgrims as a favour or *prasad* from the god a cocoanut, a piece of cocoa-kernel with some turmeric, and a blessing.

Priests.

The temple priests are Guravs not Brahmans. Of the temple revenues, the offerings for two months and eighteen days or seventy-eight days in all, the Saturdays Sundays and Mondays or twelve days of *Ashvin* or September-October, the first six days of *Margashirsh* or November-December, and the whole or sixty days of *Paush* or January-February and *Magh* or February-March, are received and administered by a committee who manage the temple affairs. The revenue for the rest of the year goes half to the Guravs and a quarter each to the Ghadshis or musicians and the Virs or mace-bearers, two classes of temple servants.

The municipal pilgrim tax is levied for four months from about December to April. Admission to the temple is free for the rest of the year. The right to collect the tax is put to auction, there being two farms in the year, one for *Chaitra* and the second for the three other pilgrimage months *Margashirsh*, *Paush*, and *Magh*. In 1882-83 the revenue from the pilgrim tax was £210 (Rs. 2100). The rates are a quarter of an *anna* for children under twelve and half an *anna* for persons above twelve. The number of pilgrims attending each fair is said to vary from 2000 to 5000 or 6000.

Trade.

The business done at Jejuri is small and is mostly confined to the sale of the food required by the pilgrims, articles used in the performance of religious ceremonies, tokens of the fair, and small presents to be taken home for wives and children. A few traders, principally Kunbis and Musalmans, come from Supa and Poona and set up booths in the streets, and a few shops are permanent. The articles chiefly sold are red and yellow powder, cocoanut-kernels, and split and parched pulse. Groceries, vegetables, fruit, sweetmeats, copper and brass vessels, images of gods, bangles, and caps and coats for children are also sold but in smaller quantities. The fairs are also attended by considerable numbers of blanket-sellers but by very few cotton-cloth sellers.

There is a municipal tax on booths the scale of rates being 2s., 1s., 6d. and 3d. (1 rupee, 8 as., 4 as., and 2 as.). After each fair a subcommittee of two of the municipal commissioners settle at which of the above rates fees are to be levied, the rate being fixed with reference to the number of people who have attended the fair and the amount of business which has been done. The Jejuri municipality was established in 1868 and in 1882-83 had an income of £303 (Rs. 3030) and an expenditure of £292 (Rs. 2920). The income is chiefly drawn from octopi and the pilgrim tax.

History.

In 1662 Shahaji the father of Shivaji visited Jejuri temple among other places in Shivaji's territory. [Grant Duff's Marathas, 85.] In 1792 Captain Moor described Jejuri as a pretty large town inhabited by Brahman beggars. The temple was on the top of a range of hills ascended on the north-east by a flight of handsome broad stone steps. Arches were thrown across at intervals and there were many lamp-pillars. The chief temple was old but not handsome. The enclosure was large and the stone work beautifully finished and the ground paved with flags. To the west of the temple hill was a large pond of fine stone. [Moor's Narrative, 347-348.] In 1795 Tukojirav Holkar encamped at Jejuri. [Grant Duff's Marathas, 517.] In 1813 Mr. Elphinstone describes the temple as approached by two flights of steps. The chief flight had arches over it in many places and many stone obelisks with stone projections for lamps round their sides. Within the wall was a round court within which stood the temple remarkable for nothing. The temple was dark and the god scarcely visible. Mr. Elphinstone was followed by many beggars and among others by a boy who barked like a dog. [Colebrooke's Elphinstone, I. 255 - 256. The dog-servants continue in Malhari's temple at Gudguddapur in Dharwar. The dog is so sacred to Khandoba that among Marathas the usual way of calling a dog is to cry *Khandi*

khandi.] In 1827 Captain Clunes notices Jejuri as a post-runner's station with 430 houses fifty-four shops and a temple of Khandoba where as many as 100,000 people used to attend at the great January fair. [Itinerary, 23.] In the 1845 disturbances of Raghoji Bhangria the insurgents carried off on one occasion the litter of the god with the holy image but brought it back. [See Part II. p. 308.]

JIVDHAN.

FORT.

Jivdhan, [Deccan Papers, No. 60; Mr. J. McLeod Campbell, C. S.] about 3000 feet above sea-level and about 970 feet above the plain, is a dismantled fortress commanding the Nana pass sixty-five miles north-west of Poona and sixteen miles west of Junnar. The fort, which is about 1000 yards long by 500 broad and nearly two miles round, stands within the village limits of Ghatghar on a steep and rugged hill which rises about a thousand feet above the crest of the Nana pass. Jivdhan is a square stack of a hill rough on all sides surrounded by steep precipices and presenting an abyss on the Konkan side so sheer that a stone dropped would fall almost 2000 feet into the Konkan at the foot of the Sahyadris. [Hamilton's Description of Hindustan, II. 48.] In general effect Jivdhan is much like Shivner. It differs in three points. The east scarp of Jivdhan is highest near the middle of the hill face while in Shivner the middle part is the lowest; the north point of Jivdhan is much squarer and blunter than the north point of Shivner; and the upper hill in Jivdhan is higher than the upper hill in Shivner. The road from Junnar to the foot of Jivdhan is fit for laden cattle. The ascent, which is about a mile long, is very steep and difficult and consists mostly either of loose masonry or steep sheets of rock not difficult for bare feet but troublesome for boots. For about 300 feet of the ascent a profile of rock has the remains of a stair of steep high and narrow steps with nothing below and very little on either side. The hundred feet in the middle of the stair were blown away when the fort was dismantled about 1820. Of the blown away section the middle part is not difficult to climb on all fours or to come down barefoot face foremost. But about a third at the lower and another third at the upper ends are extremely-steep. Except the hillmen few natives can go up the steepest parts and few Europeans can climb them without a rope and bare feet. The climber's only helps are small foot-holds which the people have cut in the rock and finger-holds in the bottoms of some of the 1820 blasts. The main gate was on the west towards the Nana pass with what apparently was a fine ascent, a long steep stair partly built and partly rock-cut climbing a narrow gorge completely commanded by the fort. The ascent led to a landing place, a square well about thirty feet deep, and, out of the well, the ascent passed by a tunnelled rock-cut stair to the gate. The stair was blown away and the tunnel filled in 1820 and the gate is now useless. The top has five cisterns which form the main water-supply, and some apparently Buddhist caves with a substantial Muhammadan building in front, plain and with solid masonry arches. Each compartment of the Muhammadan building has a saucer-shaped roof of good well-fitting masonry. The chief Buddhist cave (36' X 21' X 15') has a smaller cave on either side and a veranda in front. The caves were used as granaries and when the fort was captured in 1818 they were found stored with grain. The grain was burnt and its ashes

remain ankle deep. Jivdhan commands a splendid view west to the Salsette hills, Tungar, and Kaman in Bassein, and, on a clear November day, to the sea.

History.

In 1489 Jivdhan was taken by Ahmad I. the founder of the Ahmadnagar Nizam Shahi family (1490-1636), and in 1637 it was one of the five Poona forts which Shahaji gave to the Moghals. [Elliot and Dowson, VII. 60; Grant Duff's Marathas, 53.] In the 1818 Maratha war a brigade under Major Eldridge reached Jivdhan on the 3rd of May 1818. The commandant who had been summoned to surrender two days before, declined to give up the fort saying he would fight for eight days. An advanced reconnoitring party under Captain Nutt of the Engineers, were frequently fired on from the guns and matchlocks in the fort but without loss. A spot was chosen for the mortars and a battery for two brass twelve-pounders till eighteen-pounders could be got ready to play on the masonry about the gate. The mortars opened at about twelve o'clock and after an hour's firing of about twenty shells a man was sent down to say that the garrison would open the gate. This was immediately taken possession of by a party of the Bombay European Begiment. The garrison was disarmed and dismissed. [Maratha and Pendhari War Papers, 294. An officer in Major Eldridge's force describes Jivdhan (Bombay Courier, 16th May 1818) as absolutely impregnable as it had bombproofs for the garrison to retire to. The last flight of steps which led to the fort consisted of 240 rock-cut steps each 14 foot high and as steep and hard to climb as a ladder. Midway down the hill on the north-west a level ran out for 100 yards and the mountain then became as steep as before. From the edge of the small level rose a natural pillar of rock about 300 feet high nodding over the abyss below. On the south-west the hillside was so steep that a stone dropped from the hand would reach the Konkan about 2000 feet below.]

[JUNNAR.](#)

Description.

Junnar, north latitude 19° 12' and east longitude 73° 56', lies in a broad flat valley about 2000 feet above the sea, on the south or right bank of the Kukdi, fifty-six miles north of Poona, and about six-teen miles east of the crest of the Sahyadris. To the south-east the valley opens into the wide Deccan plain which spreads like a sea to low lines of flat-topped uplands far to the east and south. On other sides, within a radius of about two miles, the town is shut in by irregular ranges of hills 600 to 1200 feet above the plain. The hill-sides rise steep and bare to upper slopes crossed by level belts of rock whose smooth black walls appear in one range after another although separated by gaps of many miles. The lower belts of rock are in places dwarfed by earth and stones washed from the upper slopes, or the wall is broken where a torrent has forced its way through some crumbling or earthy vein. Still many belts of rock with rounded or wall-like fronts stretch across the lower slopes for hundreds of yards. Near the tops of one or two of the hills, notably of Shivner to the west of the town and of Hatkeshvar to the north, unbroken by torrents and unhid by earth and stones, a wall of trap 100 to 150 feet high girdles the hill-top like a huge piece of masonry work. The outline of most of the hill ranges is waving

and irregular, the tips of the higher peaks in many cases being smoothed flat as if by a plane. In others, as in Shivner and Hatkeshvar, the great wall of rock is topped by a small rounded or level hillock. Below the base of the hills runs a belt of barren upland from which bare spurs stretch towards the river, rocky or soilless except in a few dips and hollows. The outer flats have a thin sprinkling chiefly of *babhul* bushes. The town is amply shaded and has some splendid *pipal* and banian trees and the river banks are green with groves and gardens. The town, with its long winding streets and open empty spaces, stretches over a mile along the right or south bank of the Kukdi, and beyond the town to the east south and west ruined heaps and fairly preserved tombs and mosques bear witness to the greatness of Musalman Junnar.

Hills.

The hills that encircle the town form four leading groups; the low curving line of the Manmoda range to the south and southwest; the high level scarp of Shivner to the west; the lower and tamer Mangni hills to the north-west; and the high flattened tops and scarped sides of Hatkeshvar and the Suleman or Ganesh hills on the north. The Manmoda hills rise from the plain more than two miles to the south-east of Junnar. They run for about half a mile to the north, and then, with a shallow horse-shoe curve, sweep about two miles to the west and north-west towards Shivner from which they are separated by the sharp-cut gap of the Pimpada pass. Their waving irregular crest varies from 400 to 600 feet above the plain. Along the bare north-east face, about a third of the way up, runs a belt of rock, sometimes fifty or sixty feet high, in other places half-hidden by earth and stones. In this belt of rock are carved three groups of Buddhist caves: the Bhimashankar group in the east face, the Ambika group about the centre of the north face, and the Bhutling group some hundred yards nearer the north-west. To the north of the Manmoda hill, separated from them by the deep cup-shaped hollow of the Pimpada pass for nearly a mile across the valley, stretches the great flat scarp of Shivner, the hill-fort of Junnar, the birthplace of Shivaji (1627). Steep strong slopes and belts of rock rise sharp and bare about 800 feet to a great wall of rock a hundred to 150 feet high which girds its level top. In the north of the hill nothing shows above this wall of rock. Further south a smooth flat inner mound rises about 200 feet above the main hill top. Several old Musalman buildings give a special interest to the top of Shivner: a small watch-tower at the extreme north, a mosque with a fine flying arch stretching between its minarets at the north foot of the inner hill-top, and on the flat crest of the inner hill a Musalman tomb and prayer-wall. Beyond Shivner, to the north-west, appears the bare rounded shoulder of the Tulja hills with the Tulja caves hid in a hollow in its eastern face. To the north of the Tulja hills stretches the Kukdi valley, and beyond, on the northwest, the irregular range of the Mangni hills runs to the Mhar pass. To the east of the Mhar pass the steep sides of Hatkeshvar rise about a thousand feet to the great wall of trap which encircles its inner summit. Close to the east of Hatkeshvar are the dome-like crags of the Navra-Navri that is the Bride and Bridegroom, or the Varat that is the Wedding Party hill, because they say the hill opened and swallowed a wedding party and the rounded crags are their tombs. The smooth-topped hill to the south-east is known as the Suleman hill because agates used to be found there, and also as the Ganesh hill because the chief of a group of Buddhist caves carved in its lower slopes is now a temple of Ganpati. In the plain,

beyond the end of the Ganesh hill, stand a few single peaks, the remains of the south-east spur of the Suleman range. To the south, opposite the east face of the Manmoda range, the single pyramid hill of Dudhare, with its point crowned by the white tomb of a Musalman saint Pir Shall Daval, completes the circle.

The usual camping ground at Junnar is in the Bara Bavdi or Twelve Well garden to the south-west close under the great rocky face of Shivner. From the east the road to the Bara Bavdi passes through the length of the town leaving the fortified enclosure in which are the mamlatdar's and other offices on the right and passing among splendid banian and *pipal* trees about half a mile to the south-west of the town. Another pleasant camping ground lies to the north of the town in a large garden and mango grove about half a mile to the south of the Ganesh caves. At the north-west limits of the town in a large enclosure are two good bungalows belonging to the Church Missionary Society. One of these is generally occupied by the resident missionary; the other bungalow is usually empty, and, by the kindness of the resident missionary, if arrangements are made beforehand, is generally available for the use of district officers and other travellers.

Sub-Divisions.

The town covers a belt of land over a mile long and from a quarter to half a mile broad. Within these limits are many empty spaces, graveyards, gardens, and the walled enclosures of old fortified mansions. The town is divided into thirty-three wards or sections, some of them known as *puras* and others as *vadas*, of which thirteen are outside and twenty-one are central sub-divisions. The outside subdivisions are Shukravara, Syedpura, Pethfansumba, Maicha-mohalla called after a saint Mai whose mosque is in this sub-division, Sepoy-mohalla, Kothudpura, Mansurpura, Mandai, Kalyanpeth called after Kalyan Musalmans who founded it about the middle of the seventeenth century when (1648) Shivaji took Kalyan, Malvada, Fakirpura, Khalilpura, and Khalcha Malvada. The twenty-one central subdivisions are Chambhar-ali, Kumbhar-ali, Khatik-ali, Dhorvada, Mharvada, Kasar-ali, Pilucha-mohalla, Sadabazar, Chandipura, Syedvada, Ovanbazar called after Mr. Ovan an assistant collector who founded it, Varchi-ali, Shankarpura, Murlidhar-ali, Mahajan-ali, Sarai, Aditvar, Budhvar, Kagdivada, Eadarpura, and Mangalvar. In Musalman times one more sub-division to the east was called Amravatipeth. This is now Amrapur village outside of Junnar limits.

People.

The 1872 census showed a population of 10,298 of whom 8205 were Hindus and 2093 Musalmans. The 1881 returns showed an increase of seventy-five or 10,373 of whom 8367 were Hindus including; 415 Jains, and 2006 Musalmans. Most of the roads in Junnar are narrow and full of corners. They are metalled and the main thoroughfares are fairly smooth and clean.

Houses.

Junnar houses are generally one-storeyed and built on a plinth a foot or two high. The walls are of dressed or unworked stone, burnt or sun-dried bricks, or white earth, and sometimes the weight of the roof, which in almost every case is covered by rough flat brown tiles, is borne by wooden pillars. Some of the fronts, but these houses are in most cases used as shops as well as dwelling places, are enclosed with red wooden planking. The only ornament is that occasionally doors and windows end in a rounded arch with waving sides in the Musalman prayer-niche or *nimbara* style. A few of the double-storeyed houses have deep eaves and forward beams with faces carved in tracery and other ornament. In some of the richer parts of the town the street fronts of the houses, chiefly houses belonging to Brahman moneylenders, are blind walls with only a small door opening on a courtyard.

Shops.

Junnar has 288 shops, chiefly in the six sub-divisions of Aditvar, Budhvar, Kagdi-vada, Kalyan-peth, Mangalvar, and Sadabazar. The shopkeepers are Gujar Lingayat and Marwar Vanis, Brahmans, Telis, Salis, Koshtis, Kasars, Tambolis, and Musalmans. [The details of shops are: Sixty of Vani grain dealers and grocers, forty-eight of papar-dealers thirty-eight of Salis and Koshtis, thirty of oilmen, twenty of cloth-dalers, twenty miscellaneous, eighteen of goldsmiths, eleven each of betel leaf sellers and *sarafs* or money-changers, ten each of confectioners and dealers in fruit and vegetables, six of bangle-makers, four of coppersmiths, and two of dyers.] The shops are generally the fronts of one-storeyed houses which are sometimes open with a deep overhanging eave generally tiled, or the front is closed chiefly by wooden planking. In a few of the better class of shops belonging to grain-dealers and grocers the front is used as a veranda and work is carried on in an inner room. The chief articles sold are grain of all sorts, dry-fish, oil, groceries, copper vessels, turbans, women's robes, blankets Europe cloth, wool, hides, paper, and stationery. Besides shops, along the Aditvar and Sadabazar roads, people sit by the road-side offering things for sale. The sellers are generally women of the Kunbi, Mali, and Koli castes who offer plantains and other fruit, vegetables, sugarcane, mangoes, oranges, lemons, grape, and melons. Besides, generally in the mornings, at several street-corners in Aditvar, Budhvar, and Sadabazar stand groups of poor Kunbis and Kolis with bundles of grass, and others chiefly Thakurs with firewood faggots. In addition to the daily supplies on Sunday the market-day about 2000 people, chiefly Kunbis Kolis and Thakurs, come to the town. There are two markets, the old market in Aditvar ward which is held on either side of the main road, and the Ovals' Market, a broad open space along the north wall of the *kot* or fortified enclosure in which are the mamlatdar's and other Government offices. At this weekly market all articles of daily use in the town are sold in large quantities, especially fruit, vegetables, and field produce. Merchants from different parts of the Junnar sub-division, and from Ahmadnagar, Akola, Rahuri, and Sangamner, bring large quantities of grain and coarse cloth, and Kathodis and Thakurs from the Konkan bring timber and wicker-work baskets. Except the grain-merchants they come with small tents. Goods are brought in carts and on bullock donkey and pony back. The market is brisk and busy from January to April when the late crops are harvested and ready for the market, when revenue instalments are paid, and the people lay in provisions for the monsoon. Supplies fall off in the rainy season and the

market is dull.. The medium of exchange are silver and copper coins and shells, eighty shells for $\frac{3}{4}$ d. ($\frac{1}{4}$ a.). The copper coin is called *shivrai* and is said to date from Shahu (1707- 1749). There is no barter on market days. In the smaller outlying villages barter is resorted to by the Konkanis if any of their goods are left unsold and if they are in want of daily necessities. The chief articles bartered by Kolis, Konkanis, and Thakurs are *nagli*, rice, baskets, oil, onions, and salt; The people with whom they barter are Malis, Telis, and Vanis.

Trade,

The origin of the importance of Junnar as a trade centre was its nearness to the Nana pass which, in former times, at least from as early as about B.C. 100, was one of the chief highways of trade between the Deccan and the coast. The pass can at best never have been easy. Even if at one time the rough slippery pavement was a flight of steps the pass must have been difficult for laden bullocks and almost impassable for any beast of burden larger than a pony. It can never be made fit for wheels, and as other routes are provided with easy roads the trade of Junnar and of the Nana pass becomes more and more local. In the fair season considerable numbers of pack animals may be seen, ponies bullocks and donkeys, chiefly the property of Musalmans and of Hindu oilmen, potters, and washermen, carrying millet and rice eastwards to Junnar, or bringing salt fish, cocoanuts, salt, and rice from the Konkan coast. [The following details, noted in going from Junnar to Ghatghar at the head of the Nana pass on the 28th of December 1882, give some idea of the amount and the character of the present trade: Four or five bullocks belonging to a Pardeshi and driven by a Teli going west empty to bring from the Konkan salt and cocoakernels and nuts a donkey driven by a Beldar going east with local millet; a bullock driven by a Musalman going east with dried fish from the Konkan; five bullocks driven by a Teli going west with potatoes to the Konkan; two Musalman's bullocks going east with local rice; a Musalman driving ten bullocks east with Konkan rice; a potter driving eleven donkeys east with local rice; a Musalman going east with a pony load of *nachni* ; a washerman with eleven donkeys and one pony going east with local rice; a pony with glass bracelets from the Konkan; a potter going east with eighteen donkeys laden with local rice; a potter with twenty donkeys passing east with local rice; and a potter with eleven donkeys passing east with local rice.] There is also the more purely local traffic of taking droves of sheep and goats and great basket-loads of vegetables and other garden produce from Junnar and the villages round to the Konkan villages and country towns with weekly markets. There still remains to Junnar, what along with its excellent climate must always have told strongly in its favour as a capital, the rich garden and other lands to the east and south. This rich tract still supplies the chief trade of Junnar, field and garden produce which is sent in carts chiefly about forty-two miles to; Talegaon station on the Peninsula railway, along a route which the Shelarvadi and Karle caves suggest was a main line of traffic about 1800 years ago in the days of Junnar's greatness. The chief trade is in paper, women's robes, blankets, and rice. Exports consist of paper, rice, women's robes, potatoes, plantains, onions, chillies, myrobalans, wheat, gram and millet, molasses, blankets, sheep, and horned cattle. The imports are salt, cocoanuts, dried fish, rags for paper, clothing, oil, grain, metals, groceries, stationery, timber, cotton and silk yarn, country blankets, bangles, bullocks, cows, buffaloes, and sheep. The chief traders

both importers and exporters are Vanis, Kunbis, Musalmans, Bohoras, and Kasars. Except the donkeys and ponies used for the Nana pass traffic carts are chiefly in use. With better roads and a brisker demand trade is growing.

Capital.

The chief men of capital in Junnar are local Brahmans and Gujarat Vanis, Shravaks or Jains by religion, and a few Marwar Vanis also Shravaks. There are also some old grant-holders and owners of land, chiefly Musalmans; retired Government servants, Brahmans and Musalmans; some barbers traders and contractors who have made money in Bombay; and some successful oilmen and cloth and grain dealers. The imported cloth trade is chiefly in the hands of Gujarat Vanis and the local cloth trade in the hands of Salis, Shimpis, and Koshtis, and the leading grain-dealers are Marwar Vanis. Of moneylenders several are Musalmans and a few are Hindu craftsmen Telis, Salis, and Hajams. Traders, chiefly Marwar Vanis, also lend but the chief money lending class in Junnar are the Brahmans who have 150 rich houses, one hundred and forty of them Deshashth and ten Konkanasth or Chitpavan. They lend chiefly to Kolis, Kunbis, and Thakurs.

Crafts.

The chief local crafts are the handloom-weaving of women's robes and turbans and the making of paper. The handloom-weavers of women's robes are Hindus of the Sali and Koshti castes. The Salis, of whom there are sixty houses, live in the north-east of the town in Chandipura, Kadarpara, Khalilpura, and Shukravar peth. The Koshtis live in Khalilpura and Budhvar peth in the north of the town. They are between thirty and forty families who came from Sangamner in Ahmadnagar about thirty years ago. The loom is simple with only two heddles. There is nothing peculiar about it except a stretcher or *karsali* which is placed by the weaver in front of him. It stretches the web breadthways and forms a support against which the reed or *phani* is pressed to bring the warp-thread home. The yarn is imported from England; the red comes dyed and the dark is dyed in Bombay. The robes are plain without ornamental borders. Almost all are used in the town; very few are exported. The weavers are generally labourers paid by the piece by men of capital, chiefly Brahmans and Gujars and a few Salis. The rates of piece-work vary from 1s. 3d. to 4s. (Rs. $\frac{5}{8}$ - 2) representing 7 $\frac{1}{2}$ d. to 9d. (5-6as.) a day. Except during part of the rainy months (July-October) work is constant all the year round. In the same quarter of the town as the Koshtis are about eighteen houses of the Musalman handloom-weavers called Momins. They make turbans and borderless *sadis* on a small loom. The turbans are generally red and ornamented with a border of gold thread. The weavers are almost all employed by men of capital. They are paid by the piece at the same rate as the Koshtis. The turbans are sold in the town and the outlying villages or sent to Akola, Poona, and Sangamner.

Paper Makers.

A little to the north of the Koshtis and Momin weavers are the quarters of the Musalman paper-makers or *kagdis*, who have about a hundred dwellings and forty-two working

houses. The families have been settled in Junnar apparently since Musalman times. The paper which is smooth and glossy is sold at 6*d.* to 1*s.* 6*d.* (4 -12 *as.*) a *ghadi* of 240 sheets. It is used in Government offices for envelopes and by native merchants for account books. It is chiefly used in the native states and is largely exported to Poona and Sholapur. Some of the paper-makers are independent traders, others borrow chiefly from Gujar moneylenders. According to the nature of the work the men earn 1 ½*d.* to 6*d.* (1-4 *as.*) a day. Except in monsoon floods when the river water is muddy, the work is steady.

Blankets.

Country blankets are woven in the Budhvar and Shukravar wards by about thirty-five families of Dhangars and Hindu Khatiks. The blankets are sold in the town and in the Thana villages at the foot of the Sahyadris.

Municipality.

The municipality, which was established in 1861, had in 1882-83 an income of about £512 (Rs. 5120) chiefly from a house-tax, and an expenditure of about £195 (Rs. 1950). The municipality has borrowed £3300 (Rs. 33,000) to build a reservoir to supplement the existing water-supply.

Water Supply.

The town is supplied with water partly from the Kukdi but chiefly by water brought in earthen pipes from three wells. It is received in eighteen cisterns measuring on an average about twelve feet by eight, each with a pipe through which the water flows. The wells are one called Barabavdi or the Twelve Wells close to the south of the town which feeds twelve cisterns, and two at the base of Shivner hill which feed six cisterns. The two wells, which are partly built of Hindu temple stones, are near each other to the west of Shivner hill and joined by an underground channel. The cisterns hold water for eight months. In the hot months (March-May) the supply in the well runs short and sinks below the level of the pipes, and the water has to be raised by working Persian wheels. The new reservoir is being built to the west of the town. The water-works are of Musalman construction probably older than the seventeenth century. A few cisterns, built by the municipality and private persons, are kept in repair by the municipality. The Barabavdi, which was private property, was bought by Government and made over to the municipality.

Objects.

The town has of public offices a mamlatdar's, subordinate judge's, police, forest, and registration offices, a municipal office, a dispensary, and a Government and a mission school. Most of the public offices are collected in the Syedvada in the south-west of the town in or near the walled enclosure or garden which is known as the *kot*. This, which is a Musalman work, encloses an area 300 yards from north to south by about 220 from east to west, like a great garden with several; fine *pipal* and banian trees. The wall, which varies from sixteen to twenty feet high, is strengthened by fourteen towers twenty-five; to

twenty-seven feet higher, of which four are in the corners, three each in the north and east faces, and two each in the south and west faces. [The tower to the north of the gate is called Phatak, that in the south-east corner Kangara, and that in the north-west Chauk.] The wall is of rough stone below and white mud above, and the towers are some of them of white mud and others of brick either sun-dried or fire-baked. It is entered through a strong gateway in the east face. Inside, the chief buildings are the mamlatdar's office towards the north of the enclosure with two wings, an east wing for a lock-up and a west wing for a record-room. To the east is a small forest office and to the north is the office of the chief constable. To the south is the munsif's court and further west is a dwelling house interesting as having been from 1784 to 1795 the place of confinement of Bajirav (1796-1817) the last of the Peshwas. Behind are the remains of an old Musalman bath or *hamamkhana* and to the south is a ruined mosque. Under a tree near the mamlatdar's office is an old carved stone, and in the west wall of the tower to the south of the entrance gate is a stone with some Marathi writing.

Outside of the gate on the right is the Government school, a large modern one-storeyed building. Across the road is the dispensary and a little along the road to the north on the left is the Mission girls school. The dispensary which was established in 1869 treated in 1883 nine inpatients and 6392 outpatients at a cost of £76 8s. (Rs.764). The post office is about 380 yards to the north, and the municipal office is at the west end of the Sadar or chief bazar. In the south or street wall of the municipal office is a small tablet with a Persian inscription dated H. 1049 that is A.D. 1639.

The mission bungalows, in a large enclosure in the north-west of the town, are plain one-storeyed buildings, well designed, and of good size. The bungalow to the north-west is generally occupied by the resident missionary, the other is usually empty. About 150 yards to the west of the bungalows is a small graveyard with a few Christian tombs. [On two of the tombs are inscriptions.]

Gates.

The *kot* is almost the only part of the old fortifications which is at all in repair. About half a mile to the south-west of the *kot*, just under Shivner, is a space about 640 yards by 500, surrounded by a ruined mud wall known as the Juna Baitkala. Of the walls which once surrounded the town few traces remain. Beginning from the east and going round by the south and west to the north the walls had twelve gates: Hatti, Phansumba, Lal-ves, Phatak, Ovan-bazar-ves, Aditvar, Kathvar, Fakirpura, Otur, Delhi, Agar, and Nagjhiri. Two of these, Otur and Phansumba, are in good repair; six, Aditvar, Agar, Fakirpura, Lal-ves, Nagjhiri, and Ovan-bazar, are in ruins; and of the remaining four Budhvar, Delhi, Hatti, and Phatak no trace is left. The Otur (18'x 10') and Phansumba (30'x12') gates are built of stone masonry. Over the Phansumba gate is a small room reached by a flight of steps. Of Aditvar (16' x 10'), built of stone and mud, the walls remain and of Agar traces of the stone walls are left. Fakirpura (17'x7') was built of stone and mud, Lal-ves (15'x 8') of stone burnt brick and mud, and the Ovan-bazar (16' X 12') entirely of mud. Of Nagjhiri only two stone walls remain. In Sepoy-mohalla, in the south of the town along the north bank of the Lendi stream, are remains of the wall. There is the Lal Darvaja or Red Gate, a

square wooden door with old carved Hindu stones in the side walls. The walls are about twenty feet high, rough stone for the first six feet and then sun-dried brick and white earth. To the south of the gate was a dam, and another dam some distance further made this part of the stream bed or moat fit for boats. Of the old fortified mansions the most notable is in Mangalvar peth. About 230 yards north-east of the municipal office on the left is a large enclosure entered by an old gateway with a wall of white earth and sun-burnt brick. The place belongs to the Nawab of Belha, twenty-one miles south-east of Junnar, who now lives chiefly in Surat and is deserted and empty. An inscription over the entrance shows that it was built in H.1033 (A.D.1622). Except the Buddhist caves (A.D. 100-200) and the Yadav cisterns on Shivner (1050-1200) of which separate accounts are given, there are few old Hindu remains. Carved stones and pillars are found occasionally either lying by the roadside or built into the walls of Musalman tombs and mosques or of modern houses. The style of ornament shows that they belong to both Brahman and Jain temples and the style of carving is considered by Dr. Bhagvanlal to vary from the ninth to the thirteenth centuries. [The chief stones noted were: In the south-west of the town in the *kot* or citadel a broken pillar, and a few carved stones in the *kot* wall; some carved stones by the roadside close to the mission school; the pillars near the Hemadpanti well carved stones in the Lal gate in the south and in several houses near; a pillar and a carved stone outside of the east gate; at Ambapur on the way to Afiz Bagh a small temple of Maruti with several finely carved stones, among them a row of elephants from a frieze on the Elephant gate whose site a little to the east is still marked by two elephants; in a culvert a little further east; and in Musalman tombs on the way to the Manmoda hills.]

Old Wells.

Besides these fragments are three wells in the old mortarless Hindu style known as Hemadpanti. About 200 paces to the north-east of the mamlatdar's office, near a great banian tree whose roots are ruining it, is an old step-well of large black stones built without mortar in the Hemadpanti style. In the enclosure at the mouth of the well are some old pillars divided into four-sided eight-sided and round bands, broken by the pointed lines of a pyramid ornament. In the south of the town, about 370 yards from the Lal gate, in a large uncared-for garden or orchard, is the Kundal Bavdi or Round Well, a large well of great dressed stones fitted without mortar. It is entered from the south by a flight of steps which runs about half-way to the water and then turns to the west. About a quarter of a mile to the north-east is Kavla's well, a rough work of large plain dressed stones put together without mortar. It is entered by a flight of steps from the east.

Temples.

Of modern Hindu temples Junnar has about sixty, two of which are Jain. Of the Brahmanical temples, which are also used as rest houses, seven are well managed and enjoy Government grants of about £30 (Rs. 300). The rest are poor, many of them falling out of use for want of funds. The chief temples are of Panchling Ganpati, Pataleshvar, Uttreshvar, and Thakurdvar. The Panchling temple is at the foot of Shivner hill about half a mile west of the town. The temple with a hall and a shrine has a dome painted with tigers, lions, and Hindu gods. The temple enjoys a yearly grant of £6 (Rs. 60) and was

built about 1800. Attached to the temple is a rest-house, two cisterns, and a filled-up well. Ganpati's temple in Aditvar peth, at which offerings are made in all thread-girding and marriage ceremonies, is said to have been built about 1820. Uttareshvar temple lies half a mile east of the town on the Kukdi, and is approached by a flight of stone steps. It is like a one-storeyed dwelling house with a tiled roof, and, as it is surrounded by fields, it is pleasantly green in the hot weather. Pataleshvar temple is a small underground shrine (12'x 10'), approached by a flight of steps, on the north or left bank of the Kukdi, about a mile north of the town. The temple enjoys a small Government grant. Thakurdvar temple, dedicated to Krishna, is a domed building on the Kukdi, half a mile north of the town. All the other temples are like ordinary dwellings. They are poor, some not able to afford even a night light. Only Brahmans worship in the Panching temple; in the other temples all Hindus except Jains.

Of the two Jain temples one is in the Budhvar peth and the other in the Phansumba ward. The Budhvar peth temple, which is dedicated to Parasnath, is large and rich, a three-storeyed building in the dwelling-house style with a gable roof and surrounded by a brick wall seven feet high. The first storey is used for daily religious meetings which are attended by about fifty Jains out of the Jain community of 415, chiefly Gujarat Vanis cloth-dealers and moneylenders. The second storey, which contains the shrine with a naked image of Parasnath, has a middle hall and two wings. The floor is paved with coloured marble and the walls have glass-covered paintings of Jain gods. The ceiling is of carved teak and the shrine doors are lined with silver. The third storey is used as a store-room. Attached to the temple is a courtyard (48' x 17') paved with well-dressed stones. The yard has a well and a bathing place. The temple was built by the Jains of Junnar at a cost of £3000 (Rs. 30,000) and is maintained by a managing committee from offerings in grain and cash. The temple has a paid ministrant who reads and explains the holy books.

Musalman Remains.

The chief Musalman remains are mosques and tombs, a large prayer wall on rising ground to the south of the town, and the fine mansion in the Afiz Bagh. Of the mosques the chief is the Jama Masjid or Public Mosque. It stands near the middle of the town a little to the east of the *kot* or citadel. The outer door, with an inscription over it dated II. 1235 (A.D. 1818), is modern. In the mosque, which measures sixty-six feet by forty-three, are three rows of carved masonry pillars, apparently old Hindu, with in each row six pillars and pilasters. For seven to nine feet from the ground the pillars are four-sided, and then there is an eight-sided belt, and then three rows of cornice end in square capitals which support a very massive timber roof with in the east, front deep finely carved eaves and flying brackets. Except on the gate there is no inscription. To the east is a shady yard thirty paces by thirty-five with a well and cistern and to the south is a rest-house. Of the other mosques, one in good repair to the south of the town may be taken as a sample. The Roshan Mosque, about thirty yards to the south of the Lal gate, measures 42' by 19'. It is entered from the east through a pointed arch which fills the whole east front. Inside are three domes resting on two eight-sided pillars, a prayer niche in the middle of the west wall, and a roof hollowed in diamond-shaped recesses. Along the top of the east front runs a plain stone eave supported by stone brackets. About sixty yards to the east is a

domed tomb, 7' 6" by 16' and 14' high called the Mokarba. The tombs have almost all square bodies of stone masonry the sides either with open-peaked arches or masonry pillars. The square bodies are capped by brick domes, some of them round and others pointed. The following are the details of the Saudagar Gumbaz or Merchant's Tomb, the finest Musalman building in Junnar.

Merchant's Tomb.

On a raised plot of ground in the centre of a raised enclosure, about a mile to the east of the tomb, is a large Musalman tomb, the chief trace of Musalman wealth and power in Junnar. It is known as the Merchant's Dome or Saudagar Gumbaz. The building has a body about fifty-two feet square of plain stone masonry nearly thirty feet high, a heavy brick and stucco cornice several feet deep, and a large round dome which rises about twenty feet above the body of the building. About twenty feet from the ground a plain band of masonry, about six inches broad, divides the body of the building into two parts or storeys, an under-storey about twenty and an upper-storey about ten feet high. Each of the four fronts of the under-storey is divided into three rectangular recesses about 18' 9" high 11' 5" broad and 2' deep, separated from the ground by a plinth or band of masonry about 1' 9" high by 4" deep. The central recess in the south face is surrounded by a belt of simple carving about six inches broad; the other recesses are plain. Inside of each rectangular recess are two recesses with pointed arches, the outer arched recess measuring 16' 5" long by 10' 2" broad and seven inches deep, and the inner recess measuring 15' 5" high, 9' broad, and 1' 2" deep. Except in the middle of the south and in the middle of the east face, where there are doors, the only ornament in these arched recesses is a belt of simple carving about a foot broad that crosses them about nine and a half feet from the ground where the spring of the arch begins. There are also two small round carvings of flowers on each side about a foot above the belt. On all four fronts the details of the outer rectangular recess and the two inner arched recesses are the same except at the two entrances, in the middle of the south face and in the middle of the east face. In the inner arched recess in the middle of the south face is a plain doorway, 6' 4" high by 3' 6" broad. Over the door two carved brackets support an overhanging band of stone about a foot broad. On the wall, sheltered by the overhanging stone, is an Arabic inscription in three pieces of two lines each. About a foot higher is a window (4' 3" X 3' 5") with a pointed arch filled with open stone tracery, a large central star or sunflower above, and two bands of three stars each below. On either side of the central star are short Arabic inscriptions. Below the window is a belt of simple carving and on each side are three belts of carving. Except two carved grooves the wall on each side of the door is plain for about four feet. Then, about four feet from the ground, the corners of the arched recesses are carved into pilasters with three hourglass-shaped compartments separated by squares of tracery. There are inscriptions at the tops of the outer and inner pilasters on the right side and of the inner pilaster on the left side. Outside of the pilasters a band of tracery surrounds the rectangular recess. In the threshold is a line of carved stones.

In the upper storey in each of the four fronts are five rectangular recesses about seven feet by five with in each a double-arched recess, the corners of the recess being cut further back below the spring of the arch than above it. Over the rectangular recesses run two

bands of stone carving, each about six inches broad. Above the carving is the heavy cornice, whose bricks, showing through the weather-worn stucco, have a mean and ragged look.

Except that no belt of tracery surrounds the central rectangular recess and that the door is smaller and plainer, the east face is the same as the south face. The door has a pointed arch and measures eleven feet by four. Besides the belt of carving that crosses the large arched recesses, a belt runs inwards along the sides of the door at the spring of the door-arch. Above the rectangular recess are a level and an upright belt of carving and an inscription on either side of the upright belt. The north and west faces are the same as the east face except that they have no doors.

Inside the tomb measures 35' 10" east and west by 33' 7" north and south. The inner walls are eight-sided with, in each side or face, an outer and an inner pointed arched recess. The height of the outer recess is about 19' 9" and the depth eight inches; the inner recess is about ten inches lower and a foot deeper. About a foot above the points of the arched recesses wooden beams, perhaps originally the supports of a carved wood cornice or screen, stand out all round about four feet from the wall. About six feet higher in each face, three rectangular panels contain niches with pointed arches separated by plain pilasters. Where the eight corners of the main building turn into the base of the round dome a small carved bracket supports the masonry that rounds off the corner. Above the brackets, at the base of the dome, a circular belt of letters is cut in stucco about two feet broad. Above a stucco cornice about three feet broad is separated into panels by eight pillars, one over each of the brackets. Above the cornice, corresponding to the centre of each of the eight faces, is a round ornament of stucco tracery. From this the dome rises about twenty feet higher, plain and round. Of the eight faces or sides of the building, the four to the north east south and west have either doors or door-like niches. The other four to the north-east, south-east, south-west, and north-west are semicircular recesses about seven feet deep with five sides rising to a pointed dome. The walls of these recesses are plain, except that about seven feet from the ground they are crossed by a belt of five-peaked ornaments like mitres with flowing fillets about two feet broad. About a foot above the mitre peak runs a slight ornamental belt or carving. At the foot in the back wall of each an opening, about 2' 9" x 5' 9", leads to a small chamber or store-room.

In the four other sides are doors or door-like recesses. In the west face in the inner arched recess is an oblong recess (10' 4" x 5' 10") and inside of the oblong recess an arched recess (9' 2" x 4' 4") About four and a half feet from the ground, the corners of the inner arch are cut away, and, a foot below, are carved into pilasters with hour-glass or water-pot sections separated by square blocks. The recess is three feet deep. The lower part is in three faces each carved into the round-topped prayer niche pattern about 4' 6" high Above are two bands of the Kuran, then a half dome in four faces with a belt of tracery, and a band of the Kuran. The face of the rectangular enclosure above the prayer niche is carved with letters and tracery, and above the rectangular recess the face of the inner-pointed arch has seven level bands of writing and two lines at each side running up and down.

In the north face within the inner arched recess is an oblong recess (4' 7" x 6"). Within this are two arched recesses, the outer 13' X 6' and 1' deep and the inner 12' X 4' 2" and 1' 4" deep. In the back wall, about eight feet from the ground, enclosed in a rectangular block of tracery, is a lamp-niche (2' 9" x 1' 9") in the rounded *mehrab* or prayer-recess shape. A belt of carving runs across the arched recess about 6' 9" from the ground, and about 5' 6" from the ground the corners of the rectangular recess are cut away and end in a scroll pattern.

In the east face the rectangular recess and the outer of the enclosed pointed arch recesses are the same as those in the north face. The inner arch forms a doorway 11' long by 4' broad and 3' 2" deep. The corner of the outer-arched recess about six and a half feet from the ground is cut back about 1' 6" and ends in a double-rolled scroll. In the south face, inside of a rectangular recess, the same as in the north face, is an inner arched recess 13' 10" high. The upper part is a pointed window (4' 3" x 3' 5") with open tracery. Under the window is a band of plain stone about 2' 6" broad, then a door 6' 4" high by 4' 3" broad and 3' deep, the corners of the rectangular recess being cut back about six inches on each side of the doorway ending in a scroll pattern about 5' 4" from the ground.

The floor of the tomb was originally nearly filled with a platform about 27' 4" x 19' 7". The north part, which is 7' 7" broad and 2' 4" high, remains, but most of the south part, which was nine inches lower, has been broken away. In the north part of the platform is a row of eight tomb-stones varying in length from 2' 10" to 5'. The stone *tairis* laid on the tops of the tomb-stones show that all except two are men's tombs. The stones on the south part of the platform have disappeared. There is a separate tomb-stone (4' 10" x 2') opposite the east door. The tomb is used as a rest-house and its floor is covered with ashes and dust.

Afiz Bagh,

About a mile to the east of the Merchant's Tomb and two mile to the east of the town is the Hafz or Afiz Bagh. Its unfailing supply of water, fine trees, and stately old Musalman mansion, make it worth a visit. Its name is variously explained but perhaps the most plausible explanation is one which makes Afiz a corruption of Habshi, the garden and the mansion having, according to a tradition, been in the possession of, if not founded by, an Abyssinian chief. The mansion is an upper-storeyed substantial but not an inelegant building; three balcony windows on the south canopied and supported by somewhat heavy looking brackets overlook a small tank; and the east and west sides have each a bay window. The entrance is on the north, its steps flanked by bay windows like those on the other three sides. The ground-floor roof is arched and ornamented with lozenge-shaped mouldings. A little to the west of the garden on the Junnar side is a fine mausoleum locally called *dargah* or *gumbaz* which is supposed to contain the tomb of the Habshi founder of the Afiz Bagh. The mausoleum, which is entered on the south and west, has a domed roof and contains nine tombs, said to be those of the Habshi, his wife, six children, and a servant. The south entrance, within an ogee arch, is beautifully carved and pierced; it is flat-headed with pierced work above and sculptured jambs and an inscription above the lintel. The east is a narrow doorway under a pointed arch. The

interior is an octagon and every other octagonal side is embrasured and arched; while the west *mehrab* is covered with texts from the Kuran. The exterior walls form a quadrangular figure; the upper portion of the wall veil terminates in a picturesque-looking brick cornice, consisting of pointed arches resting on tiny pedestals and interlining one another. A small minaret graces each of the four corners of the buildings. In ornamentation the walls are divided into two series of blank and arched windows, the upper series consisting of five and the lower of three windows. The middle of the lower series of the south and east walls has a doorway instead of a window. [The late Mr. G. H. Johns, C. S.,]

Shivner Hill.

About half a mile to the west of Junnar the steep rock of Shivner rises over a thousand feet and stretches about a mile across the plain. The hill is triangular in shape, narrowing from a southern base of about 800 yards along a straight eastern and a deeply hollowed western face to a point of rock in the north. Near the south the lower slopes of its eastern face are crossed by a belt of rock forty or fifty feet high, which disappears northwards in the steep slope that stretches to the foot of the upper scarp. This upper scarp begins about 600 feet from the plain and rises from 100 to 200 feet, stretching from end to end of the hill a level-topped wall of black rock. In the upper and lower scarps are two irregular lines of Buddhist caves all of them small and some more like the dwellings of vultures than of monks. Above the level top of the main hill rises an inner summit crowned with a mosque, a tomb, and a prayer wall. To the north the hill ends in a narrow lofty rock scarp and rounded like a ship's stern. The west face is steep, and, in hollows, has a thick sprinkling of brushwood especially to the south-west. The lower slopes are in places broken by belts of rock, and about eight hundred feet from the plain a great wall-like cliff sweeps from the north to the south-east and then round a deep hollow stretches to the south-west. The south-west face of the hill is lower and more broken, and, from about half-way up, is strengthened by outworks and bastioned walls. As on the east side, the crest of the hill which is level in the north rises in the middle in a bare flat-topped ridge, and towards the south-west again falls to the level of the northern scarp.

Shivner is interesting as showing traces of five sets of proprietors Buddhist monks, early Hindu kings, the Musalmans, the Marathas, and the English. During the first and second and probably third centuries after Christ the hill seems to have been a great Buddhist centre. About fifty cells and chapels remain. They are found on all three sides of the hill, but most of them are cut in its eastern face. Besides the cells and chapels, on the upper slopes and on the hill-top, old rock-cut steps seem to show that some of the open water cisterns are as old as the Buddhists. Traces of old rock-cut steps, deeper and broader than the monks' steps, and the four finest water cisterns on the hill, show that before Musalman times the hill was used as a fort by Hindu kings, probably the Devgiri Yadavs (1170 - 1318). The pointed arches of the gateways show that all or nearly all of the fortifications are Muhammadan. And besides the fortifications most of the buildings on the hill top, the Ambarkhana, the prayer wall, the tomb, and the mosque, and probably many of the cisterns are Musalman (1300-1750). Though it was the birth-place of Shivaji there are no certain traces of the Marathas except some repairs in the walls and the shrine

of Shivabai near the top of the southern face. The only signs of the English are a row of olive bushes on the south face and a row of teak trees along the east face of the hill top.

Fort Details.

The entrance to the fort is from the south-west. The way from Junnar lies along a well made road from the south-west of the town across the Lendi stream between some old Musalman tombs and gardens. To the right are the ruined mud walls of the Juna Ghat Killa, a fortified enclosure where the mamlatdar's office used to be held, and behind it the steep slopes and bare scarps of Shivner. To the left is the old garden and favourite camp of the Barabavdi or Twelve Wells and to the south the Manmoda hills. Beyond the Barabavdi the road winds up the bare east face of the Pirpadi pass whose crest is perhaps a mile to the south-west of the town. [Close to where the path up the hill leaves the road is a rock-cut pond measuring twenty-one feet by twelve. Some years ago near this pond were some twelfth century figures which have disappeared, except one group of Mahadev and Parvati in which the clever carving of the snake on Mahadev's left hand is worthy of notice.] The path up the hill turns west from the main road a little below the crest of the pass. From an old banian tree fifty or sixty yards to the west of the road the south face of the hill is seen stretching on the right in a long line from east to west. At the south-east end the scarp is broken and at no one place is it more than thirty feet high. It is crested by two walls strengthened by towers which run about a hundred yards west enclosing a long narrow belt known as the *Jibhecha Pada* or Tongue Watch. To the west the scarp becomes higher and less broken and again falls away to the southwest where it is strengthened by a triple line of walls. For the first 200 paces from the banian tree the path lies across a slope of fiat rock. It then begins to rise keeping almost west across the under slopes of the hill. To the left the sides fall gently and to the right the upper slopes rise quickly to a lofty scarp. Two hundred paces further the path has reached a higher level with rocks in the lower slope, bushes in the upper slope, and trees on the crest. During the next 300 paces (400-700) the rise continues gently with some old *nandruk* trees close by and patches of prickly-pear above. At the foot is the deserted village of Bhatkal, once the market of the fort, the Patil's and the Mhir's being the only houses left. To the right the scarp is divided into two parts, an upper and a lower, and between the two a wall runs from the crest of the bill along the edge of a narrow terrace about 200 paces west to Shivabai's shrine. This outwork is called the Phatak Tower. About 900 yards from the starting tree the path begins to rise rapidly, climbing the hill-side by a rough paved ascent between thickets of prickly-pear. About a hundred paces further (1000 yards) the upper rocks of the hill-side become one sheer cliff. About fifty paces further (1050) is the first gate. It is about 100 feet below Shivabai's shrine, and is covered by the main wall and by a second line that runs from Shivabai's shrine down to the gate. To the left the lower slope is green with *babhul* and prickly-pear. On the east face of the gate is a rectangular recess about an inch deep, and inside of it a double-peaked arch opening with scalloped waving edges. The rectangular recess is broken at the top. The outer arched recess measures 10' 4" high by 6' broad and 6" deep and the inner arch 9' 6" high by 5' 9" broad. On each side of the door are towers of dressed masonry which are now little higher than the front of the-gateway. The doorway, which is entered by three steps, is 12' 11" deep with an arched roof 12' 3" high. On a plinth 1' 10" high are side-rooms 7' 5" by 5' 8" and

5' 9" high with round arched roofs. A flight of steps on the left formerly led to an upper storey. Inside of the gate on the right the scarp is much lower than it is outside, not more than fifty or sixty feet high. Above the scarp rises a wall pierced for musketry and with one or two bastions with openings for cannon. On the left runs a weak parapet three or four feet high, and below are steep slopes of rock and prickly-pear. Inside of the first gate the path is flat but rough with rocks and exposed to the fire of Shivabai's bastion above. On the left, about 160 paces from the first gate, is the Mang's Tower (16' 7" x 14' 3") with a wall about five feet high and two openings for cannon. On the right, as the scarp is much lower and the rocks are more broken and sloping, the wall has been raised to about fifty feet, part of it being later than the rest. About eighty-five paces further, or about 2295 paces from the starting tree comes the second gateway, called *Parvangicha Darvaja* or the Permission Gateway, in a wall which runs at right angles to the path for about fifty paces up the hill-side with two towers pierced for musketry, and with embrasures for cannon. The gateway, which is 18' 2" high and has two short side-minarets, has an outer rectangular recess and a double-pointed arch, the outer arch 10' 1" high and 7' broad, the inner 9' 6" high and 5' 10" broad. On each side, level with the point of the outer arch, is a mystic tiger, the tiger on the left with an elephant in its right forepaw and the tiger on the right with an elephant in its right forepaw and two under its hind feet. Over the middle of the door is an elephant with a broken trunk. The door is 6' 3" deep, the top is arched, and there are no side rooms. To the left is a ruined tower. From the second gate a narrow flat path between rocks and a wall runs about eighty paces to the third gateway (2375), which is flanked on the right by a wall with a rough round parapet that runs up the face of the hill. This gate is known as the Hatti Darvaja or the Elephant Gate. The whole height of the face of the gateway recess and outside is 21' 9". On the east face a shallow rectangular recess encloses a double-arched recess the outer 15' 5" high and 9' 7" broad and the inner 13' 5" by 6' 4". In the face of the wall, in a line with the peak of the outer arch, is a circular slab filled with geometric tracery and to the left a tiger. The right face of the wall has fallen. On the parapet above the gate are three stones carved with geometric designs and below on the ground are some of the carved stones that were on the right face of the gateway. The depth of the doorway is seven feet. Twenty paces (2395) between high rocks or thickets of prickly-pear lead to the fourth gateway, which, from a Musalman tomb hid among prickly-pear on the left, is known as the Saint's or Pir's Gate. A flanking wall climbs the hill side to the right. The Saint's Gate is larger and more carefully finished than the others. It has a total height of 22' 2" and consists of a central and two side faces with a total length of thirty-eight feet. In the central face is an outer rectangular recess 21' 8" high 11' 7" broad and about four inches deep. In this is a double-pointed arched recess, the outer recess 20' 3" high 11' 7" broad and 1' 4" deep, the inner recess about 18' high 8' 4" broad and 6" deep. Inside of the inner recess a large slab crosses the arch about 11' 6" from the ground and forms the lintel of the doorway. On each side of the doorway is a rectangular seat 3' 7" from the ground and 2' 4" broad. The central face is separated from the side faces by a plain outstanding belt of masonry about 2' 9" broad, with two small arched recesses at the level of the middle of the lintel of the doorway. The side rectangular recesses are 15' 5" high and the enclosed arched recess 14' 5" high by 8' broad and 2' 2" deep. To the left of the left side recess is a carved boss of stone. The gateway is 17' deep with a central stone dome. On either side, on a plinth 3' 8" high, is a guard-room 11' 3" x 12', with a dome fifteen feet, high resting on four peaked-

arch recesses. In the back walls are arched niches 3' 9" x 2' 3" and in the side walls smaller arched niches 2' 10" x 1' 7". Inside are the ruins of houses. On the right is a broken cistern and on the left is a level belt about thirty yards broad covered with prickly-pear. Among the prickly-pear is a great grindstone about three feet across. The outer edge of the scarp is strengthened by a low parapet wall. To the right the hill side rises in bare slanting rocks with a high wall and a great outwork in front on the top. For a hundred paces (2495) the path keeps to the west. the last thirty-five paces leading up a paved way with space on the left or south-west where the parapet wall is raised into a line of fortification and runs to a point about fifty paces to the left. At 135 paces (2530) the path divides into a way for horses and a way for men, the way for horses rising by a more winding ascent to the north-west and the men's path climbing the sloping face of rock by a flight of fifty rock-cut steps. This part of the ascent is right in front of a great outwork about thirty-three feet high that runs before the fifth, or, as it is said to be called, Shivabai Gate. After about thirty-five paces the path turns to the left up a flight of twenty steps with the great outwork on the left and another wall in front. At the top of the flight of steps the path passes between walls about twenty feet high twenty-one feet to the west and then six paces to the north. The distance from, the Saint's Gate to the Shivabai Gate is 265 paces (2660). As on the other gate fronts, in the face of the Shivabai Gate, a shallow rectangular recess encloses a double-pointed archway. The rectangular recess is 17' high 9' broad and 2" deep, the outer pointed arch is 15' high 8' 8" broad and 6" deep and the inner arch 14' high 5' 6" broad and 1' 2" deep. Inside of the inner arch is a door of teak strengthened by iron spikes in fair repair. The doorway is about 24' deep, 9' 4" broad, and about 19' to the roof which is flat. At each side on a plinth about 4' 3" high are side-rooms about 8' 8" x 6' 2" with pointed arched roofs about 10' high. Above the gateway was an upper storey now in ruins. Inside of the Shivabai Gate the hill still rises in sloping rocks to an inner wall about thirty feet high, the third of the lines of fortification which guard the, entrance to the fort. To the left an old partly rock-cut path leads to some Buddhist caves and cisterns the edge of the hill-top to the left being strengthened by a wall. To the right of the Shivabai Gate, inside of a parapet wall about six feet high, a path, leaving the way up the hill to the left, runs east about 290 yards along a level terrace to a small arched gateway 12' 4" high. The arch which is 10' 4" high has scalloped edges and flowers and leaves carved on the face. On either side is a rounded pilaster about 6' 7" high and 5' 11" apart. Inside of the doorway are side recesses (5' 9" x 2' 10" x 6' 5" high) on a plinth 1' 10" high and with arched doors 3' 6" broad by 5' 6" high. At about sixty paces to the east of the inner face of the gate, old Buddhist rock steps and modern masonry steps rise in four flights of two to five steps each separated by stretches of level pavement to the temple of Shivabai. The temple stands on a masonry plinth 15' 10" high 61' long and 25' 9" broad. Inside it measures 27 feet into 21 feet; it has two rows of five wooden pillars on each side and a large shrine enclosed in a wooden lattice-case standing out from the north wall. The hollow in the rock behind shows that the temple stands on the site of a Buddhist cell or hall. [Details of Shivabai's temple are given below pp. 197-199.] To the east, with a broken wall on the left, the terrace runs about 200 paces to the Phatak tower. To the west are traces of a flight of old rock-cut steps leading to two open-air rock-hewn ponds about eighteen paces long by eight paces broad. Near the temple and on the terrace are several *champha* trees, and some pomegranate bushes, a *pipal* or two, and one large tamarind. After visiting Shivabai's temple the way lies back along the terrace to

about forty steps to the east of the Shivabai Gate. Here the path up the hill turns to the left by old worn rock-cut steps between two rock-hewn ponds about sixty-five feet by nineteen. It passes with a gentle slope to the north-east for about a hundred yards and then begins to climb the hill face up rough masonry steps and pavement. Most of the way is covered on the left or north by the battlements of the top line of fortifications and in front by two gateways, the inner over-topping the outer. There is a low masonry wall on the right. At 100 paces more (or about 240) from the Shivabai Gate, and 2900 from the starting tree, is the sixth or Phatak Gate, the approach passing under a wall of rock about twenty feet high covered by a masonry wall about twelve feet higher. The height of the Phatak Gateway is 16', of the rectangular recess 11' 6", and of the inner arched recess 10'; the breadth is 8' and the depth 12' 4" with side-rooms about 6' x 5', and, on the right, an inner room 7' x 7' with arched niches in the three walls. From the Phatak Gate about thirty-nine paces lead up a straight steep path with, on the left, a cliff about twelve feet high and a cresting wall rising from twenty to about thirty feet as it nears the seventh gate called the Kulapkar Darvaja. As in the other gateways the face of this gate has a rectangular recess with an inner double arch. The gateway is 21' high, the rectangular recess 18', the outer arched recess 14' 6" and the inner arch 12' 6". The door is about 6' broad and 30' 6" deep. It has been a double two-storeyed gate and has a guard-room on the left about fifteen feet long. To the left are the remains of buildings and over the gateway is a room with a south-fronting window which is very notable from the lower slopes of the hill. Beyond the seventh gate the path, with a low wall on the right, leads about thirty paces east along nearly the crest of the hill-side to a ruined gateway, twelve paces deep, which seems to have had an upper storey. About thirty paces more, or about 3000 from the starting tree, lead to the hill-top.

Hill Top.

On the hill-top, to the north-east from slightly swelling rocky under-slopes, the central rounded mound of the upper hill rises 200 or 250 feet with steep grassy boulder strewn-sides. On the main or lower hill-top to the east are the remains of houses hid by trees. To the north-west are stretches of sloping rock with large rock-hewn cisterns. About thirty yards to the west, with some olive bushes on either side of the approach, is the plinth of a large building known as the Sadar or Commandant's camp. The olives were planted about 1841 by Dr. Gibson, the first Conservator of Forests, who used to spend some months of each year on the top of Shivner. The large building about sixty paces further west is the Ambarkhana or elephant stable. It measures about thirty-eight paces east and west and eighteen paces north and south. Inside it is divided into three lines of seven rooms in each line, each with a vaulted roof on pointed arches 14' 9" by 12' 8". and about fifteen feet high. A steep flight of steps leads up the north face, and the flat roof, which is seventeen feet high, commands a view of the whole country to the west and south. Much of the ground near the Ambarkhana is covered with ruins. About a hundred yards beyond the Ambarkhana, the north-west end of the hill is enclosed by a battlemented wall with lozenge-shaped battlements 4' 4" high by 3' broad and 3' 8" apart.

The hill-top forms a triangle of which the south face is the base. The length of the south face is about 820 paces, of the east face about 1100, and of the west face about 1380. In

the centre stands the upper hill-top, a steep mound 200 to 250 feet high, rising sharp from the east and with a gentler slope from the west, and along the north face and in the narrow tongue that runs to the north leaving a considerable belt of nearly level ground. The 820 paces of the south face stretch nearly east and west. Beginning from the south-west end, the first hundred yards lead to near the Ambarkhana, the second hundred yards to beyond the Commandant's house, the third hundred yards to where the path up the hill gains the hill-top, and the fourth hundred yards to the end of the buildings. The next 300 yards are across sloping rocks with some rock-hewn and masonry cisterns on the left, and, on the right, a few young teak trees and a low parapet wall. Beyond, on the right, for the last sixty or seventy paces, at the south-east corner of the hill, an outer line of wall encloses the top scarp in the shape of a tongue known as the Tongue Watch or *Jibhecha Pada*. The east face runs nearly north and south in a straight line of about 1100 yards. Except in the south-east corner and in the long point that stretches to the north there is little level ground on the crest of the hill, the slopes of the upper hilltop rising almost immediately from the edge of the scarp. The east hill-top, except in the extreme south-east and in the north point, has no cisterns. It has a line of young teak trees running under the shelter of the upper hill, which, like the olives, are said to have been planted by Dr. Gibson. About a hundred paces lead from the south-east corner of the hill to the beginning of the rising ground at the foot of the upper hill-top. Six hundred paces more lead to the north end of the upper hill slopes and about 400 more to the overhanging outwork at the extreme north end of the hill. About the middle of the east face is a short cut to Junnar. This was formerly much used, and, though the path was destroyed by the British, the rock is said to be still scalable by a clever climber. Traces of old walls remain near where the path reached the hilltop. Except there, and at the two ends, the east scarp is so sheer that no parapet wall is required. From the north point the western cliff, which has a total length of 1380 paces, bends with a sharp corner to the south-east, and, forming a deep hollow, turns again to the south-west. Except at the north and the south ends, where it is crested with a wall, the sheer, almost overhanging, cliff defies approach.

Upper Hill.

From the crest of the scarp, except at the north and south where the ground is nearly level, the slopes of the upper hill begin to rise but much more gently than the eastern slopes. The steep bare sides of the hill-top end in a flat summit seventy or eighty paces broad. The upper hill fills almost the whole of the main or lower hill-top except that it is surrounded by a narrow level or sloping belt to the west and south, and that a flat point about 160 paces broad and 400 long runs to the north.

Besides the Ambarkhana near the south-west corner the chief buildings on the hill-top are, on the crest of the upper hill, a prayer-place, and a domed Musalman tomb. At the south end of the narrow flat point that runs to the north is a mosque with a fine flying pointed arch between its minarets, a little further is a round mansion, and at the extreme north an outwork. This overhanging northern scarp has the interest of being the old place of execution. From it at least till as late as 1760 prisoners were hurled. In that year seven Kolis who belonged to the party of Javji a notorious Koli outlaw were seized by Ramji Savant a Peshwa officer at Junnar and hurled down this north scarp. [Details are given in

the Ahmadnagar Statistical Account, Bombay Gazetteer XVII. 405.] There are also about thirty cisterns or rock-hewn ponds of which one is on the top of the upper hill, twenty-five on the main top, of which eleven are in the west side, eleven in the south side, and three in the east side, and five are in the upper slope of the southern hill-side within the outer wall. Several, probably many, of these cisterns are Buddhist, belonging to the times of the caves, that is the second and third century after Christ. The four finest, which are supported on massive pillars and run into the hill-side, probably belong to the times of the Devgiri Yadavs, a little before the Musalman conquest at the close of the thirteenth century. Of these four great under-ground cisterns in the main hill-top, one is in the south top about sixty yards north of the entrance gateway, two Ganga and Jamna are in the west slopes of the hill-top, and one is under the mosque at the foot of the north slopes of the upper hill. Of the Musalman cisterns, which probably include all which are neither Buddhist nor Yadav, two, one in the north point and one near the south-east end, have masonry sides.

On the upper hill-top, besides a rock-hewn pond and some ruined houses, are a prayer wall or *idga*, and a domed Musalman tomb. To the east of the prayer wall is a pavement about twenty-six paces long by eight broad. The wall is about eighteen feet high and is topped with a line of nine battlement or lozenge-shaped slabs ending in two towers with small minarets. In the middle of the wall eight very steep steps lead to a pulpit 9' 8" from the ground formed of two big stone slabs together 3' 8" by 4', with two upright slabs at the sides about 1' 7" high. The east face of the wall is carved into a central and two side recesses each with an outer rectangular recess about two inches deep and an inner arched recess about 1' 6" deep. The centre rectangular recess is 15' and the centre inner arch 10' 6" high and 7' broad, the side rectangular recess 13' 4" high and the side arched recess 10' 6" high or the same height as the central arched recess; the breadth is 6' 3". In the wall, behind the foot of the pulpit stairs, is an arched door 2' 4" by 4' 8". About fifty yards to the north is a square Musalman tomb with a plain well-dressed stone body, four pointed open arches one on each face, and a rounded brick dome. The tomb stands, on a masonry plinth 25' 3" by 29' 2" and 3' 8" high. It is entered from the south by two stone steps. On the southwest and north the plinth is about 1' 6" broader than the tomb and to the east it is 5' 6" broader. In each face of the tomb is a rectangular recess 13' 10" high 8' 2" broad and one inch deep. In each rectangular recess is a double-pointed arch the outer 12' 6" high, 8' broad, and 4" deep, and the inner, which is an open arch, 12' 1" high and 7' 4" broad. Above the arch is a stone plate about a foot long by nine inches broad with passages from the Kuran and on each side are two carved bosses. Above the rectangular recess runs a plain belt of masonry, and over it a masonry cornice of thirteen lozenge-shaped or battlement-like slabs with corner minarets. Between the outstanding belt of masonry and the cornice, a line of Arabic writing stretches nearly the whole length of the east face. The inner measurements are 15' 7" by 15' 9". The floor is paved with well dressed stones, and, in, the centre, a stone tomb 2' 3" high rises in five steps from a base 6' 6" long to a top 4' 11" long. It seems to have been a man's tomb. In the sides where the spring begins, about 4' 10" from the ground, the corners of the arches are cut back about 3". In each corner between the arches, about 5' 4" from the floor, a centre and two side brackets support a masonry face about 5' 4" broad and 6' high. In each face is a rectangular recess an inch deep 5' 4" high and 3' 6" broad. In the rectangular recess is an arched half dome

about 4' 6" long 3' 2" broad and 2' 2" deep. The half dome has five faces and arched niches carved in the inner side faces. Above is an eight-sided plain cornice about 2' 2" broad. Then about 14' 6" from the floor eight brackets stand out and cutting off the corners support the round brick dome. In the base of the dome is a row of sixteen panels 3' 10" high with pilasters between. Above this is a round plain dome perhaps about eight feet high.

View.

Near the tomb the hill-top commands a wide view. To the east a broad plain broken by a few low hills stretches to distant lines of level-topped uplands. The west and north are full of hills, whose bare sides and under slopes are relieved by the rich groves and garden-lands of the Min valley. To the north-east, almost at the hill-foot, lie the citadel, the brown-tiled roofs, and the scattered trees of Junnar. The town stretches in a long line along the right bank of the Kukdi, the river showing in winding reaches and with patches of bright green garden-land on either bank. To the east of the town stretches a bare plain with a scanty sprinkling of trees, broken by one or two low pointed hills, the remains of the south-east spur of the Suleman range. On the north-east horizon are the high flat-shouldered hills of Gidaria and Bhamberi near Udupur in Junnar. To the east are the flat-topped hill above the large village of Otur and Gavlia hill in Pimpri-Pendhar village. Further to the right is Ale village hill, its long level outline broken by the gap through which the main Nasik road runs. Below, close at hand to the south-east, stretches the irregular line of the Manmoda hill-tops. To the east, like islands from a great sea, rise from the plain the single hill of Dudhare, and further to the south-east, much like Dudhare in shape, the hill-fort of Narayangad. To the south close at hand is the Suralia hill and to the south-west is the level-topped Chincholi-Parunde range with two peaks of the higher hills of Khed showing behind. A little to the west stretches the richly-wooded garden-land of Minner or the Vale of the Min, and, above the lowlands, to the west rise the bare level ranges of the Kala-Thamba hills with a pass leading to Bhimashankar. A little to the north in the distance are two hills with small square cupola-like tops, the south most of which is Hatej and close to the north the great hill of Dhak, the opening to the A'mboli pass, and the southern top of the range that running north into the Junnar valley ends near the Nana pass in the great hill-fort of Jivdhan. To the north of the hills that bound the Min valley, close at hand the Tulja hills hide all but the south-east point of Chavand and the other hills including Jivdhan, which form the southern boundary of the Kukadner or Vale of the Kukdi, as the broad strath that leads from Junnar west to the Nana pass is commonly but incorrectly called. Nana's Thumb or *Nanacha Angtha*, the great rock that stands sentinel over the Nana pass is hid, but the low bare hill to the north of the Nana pass can be seen. Further north the broken western face of the Anjanola hills marks the end of the range that forms the northern boundary of the Kukdi valley. The rest are hid by the long lines of the Mhesardi and Mangni hills with the scarp of Hadsar fort showing between them. To the north of the Mangni hills, over the Mhar pass, stand the huge level shoulders and the gently pointed top of Harishchandragad (4691) one of the highest of the Sahyadris, having two or three level layers of trap which have disappeared from the lower surrounding hills. To the north close at hand, across the Junnar valley, are the scarped sides and level top of Hatkeshvar. Behind Hatkeshvar are the row of rounded

tomb-like knobs of the Varhad or Navra-Navri rocks, and to the north-east the circle is completed by the scarped sides and flattened peak of the Suleman or Gane'sh Lena hills.

Flying-Arch Mosque.

To the north, at the foot of the upper hill, is a mosque with a west wall about fifteen feet high whose outer face has fallen. At each end of its east face, about 24 feet apart, minarets rise about twenty feet above the roof. Inside of the minarets, clinging to them for about ten feet, springs a flying arch, which, about fifteen feet above the roof, stretches to a point halfway between the minarets. To the east of the mosque, entered from the north side, is a court 55' 8" by 17' 2". The mosque, which is of rough stone masonry, has a broken stone eave about two feet deep and a plinth 18" high. The east face is a pointed arch 17' broad at the base. On the right hand, near the top of the east wall, is an inscription and on the left corner it; another inscription slab, but the letters are worn. The inner measurements of the mosque are 16' 7" by 23' 2". In the centre is; a round brick dome, and in the three walls to the south-west and; north are three peaked-arch recesses, the west recess 2' 8" deep and the north and south recesses 3' 8" each. In the west face is pulpit and an arched prayer-niche and three small niches about 4' 4" from the ground. To the east an arched doorway leads, down a steep flight of steps, to an open air pond or cistern about 75' long 20' 8" broad and 20' deep, the upper half of the wall being masonry and the lower half rock. In the south wall are stone stanchions for working a water-bag. Under the mosque, to the west of this outer pond, is a great rock-cut reservoir the roof resting on two rows of two pillars and two pilasters. It is about eighty-six feet long forty broad, and about sixteen deep. It holds about twelve feet of water during the rainy season and at other times about six. The front of the reservoir is a plain rock cave about six feet deep and a veranda with seats 3' 7" broad with a back 1' 8" high and 10" broad. The veranda is broken by two central pillars and two other pillars halfway between the central pillars and the end pilasters. The central pillars are about eight feet apart and support a massive slab of rock. The other veranda pillars have plain massive four-sided shafts 3' 10" high with faces 2' 8" broad and capitals 3' 6" broad and 10" deep. In the capital is a central flat belt about five inches broad, and on each side a central band of three inches and two receding bands above and below. The corners of the square capitals end in little horns or knobs. On the top of the capital is a square plate about half an inch thick; above the plate is a neck about an inch and a half thick, and on the neck a bracket capital divided into four faces 1' 9" high 2' 10" broad-and standing out about 9" beyond the line of the capital. Each face is carved into two rolls. The style of the work is Hindu not Musalman, though it is perhaps not much older than the mosque, being probably the work of one of the later Yadav kings of Devgiri. A flight of rock-cut steps outside of the mosque enclosure separate from the flight of Musalman masonry steps shows that the makers of the mosque were not the makers of the cistern.

To the north of the mosque is a ruined Musalman mansion with, in the upper storey of the east wall, the remains of a handsome bracket support for a bow window. Beyond is a large empty pond with masonry sides about eight feet deep. It is thirty-three paces long and about thirty-three paces across at the broadest from which it narrows northwards to a point. Further north are more ruined houses, and at the extreme end of the point

overhanging the scarp is a ruined outwork. A flanking wall runs on the crest of the scarp for some distance along both the east and the west face. Along the west face, about eighty-five paces to the south-west of the mosque, are two great cisterns like the cistern under the mosque. Each has an outer pond about 33' into 18' with three plain four-sided pillars at the back, and inside of the pillars a great cistern hewn thirty or forty feet under the hills, the roofs supported by two rows of two four-sided pillars. These cisterns are known as Ganga and Jamna, and, like the cistern under the mosque, probably belong to the time of the Yadavs. Beyond Ganga and Jamna are several small rock-hewn cisterns, and on the right, about 500 paces from the end, begins the line of fortifications that crowns the south-west corner of the hill.

Buddhist Caves.

The [The cave accounts are contributed by Dr. Bhagvanlal Indrani, Hon. M. R. A. Soc] Buddhist caves in the hill sides round Junnar number 135 with about 170 distinct openings. Of these ten are *chaityas* or chapel caves, and 125 halls cells or separate dwellings many of them with more than one inner cell. Besides these many small cisterns and rock seats have not been numbered. All these caves are in the early Buddhist style and probably range in date from the first to the fourth century after Christ. Almost all are plain and the only object of worship is the relic-shrine or *daghoba* of which there are ten. The caves are fairly rich in inscriptions numbering thirty-five. Most of the inscriptions are short and contain little but the name of the giver and the description of the gift. But seven have some historical interest. Of the whole number of cuttings 138 are without inscriptions. Of the halls cells and cisterns that have inscriptions nineteen have one and two have two; and one of the chapels of the Ambika group in the Manmoda hills has no fewer the eleven.

The Junnar caves may be arranged into five groups. The Manmoda caves, from one to two miles to the south and south west of the town, are fifty in number of which four are chapels and forty-six are dwelling caves. These caves form three subordinate groups the Bhimashankar caves in the south-east, the Ambika caves in the north, and the Bhutling caves in the south-west. The second group is in the side of Shivner about half a mile to the west of Junnar. The Shivner caves include three groups on the east, on the south, and on the west faces of the hill. They include sixty-five openings of which three are chapels and the rest halls cells and cisterns. The third group is about two miles to the west of the town in the east face of the Tulja Hills behind Shivner. This contains eleven caves of which one is a chapel cave and the rest halls cells and cisterns. The fourth group is the Ganesh Caves in the south scarp of the Suleman hills about a mile to the north of the town. This group includes twenty-six caves of which two are chapels, twenty-four halls or dwelling cells, and fifteen cisterns.

Manmoda Caves.

At the south-east end of the Manmoda hills, facing east about 200 feet above the plain, and going from south to north, is a group of Buddhist caves known from the local name of the *chaitya* or chapel cave as the Bhimashankar group. The Bhimashankar caves are

about a mile to the west of the Poona road and about a mile south east of Junnar. The path to the caves lies across rocky under-slopes up a steep but easy ascent. The caves face the single peak of Dudhare which has a tomb of Pir Shah Daval on the top. The view beyond is across a wide plain sprinkled with trees and bounded by level lines of distant hills.

Cave I.

Cave I. is a *layana* or monk's dwelling. It is in two parts, a veranda and three cells in the back wall with plain doorways opening on the veranda. The doorways are nearly equal in size and all appear to have grooves for wooden frames. The first and second cells are nearly equal in size but the third is about two feet broader, and has a two feet broad bench. The first cell is about 7' 10" deep 6' 8" broad and 6' 9" high. The doorway is 2' 2" broad and 6' 5" high. The second cell is 8' deep 6' 10" broad and 7' 5" high with a doorway 2' 2" broad and 6' 3" high. The third cell is 7" deep by 9' 2" broad and 7' high with a doorway 2' 1" broad and 6' 3" high. Along the left wall is a bench 2' broad and 2' 6" high. The side walls of the cells vary in length. The veranda is 18' 10" broad 10' high and 6' 3" deep with about six inches in front broken. In front of the veranda are two pillars and two pilasters on which the veranda beam rests. The shapes of the pillars and pilasters are of the style common to the Andhra period [The Andhra period is called after the Andhra or Andhra-bhritya kings, who chiefly from Paithan or Pratisthan on the Godavari about fifty miles north-east of Ahmadnagar, ruled the whole breadth of India from about B.C. 90 to A. D. 200.] consisting of an octagonal shaft with waterpot bases and capitals. The waterpot at the base rests on a round ring over four square plates each plate larger than the one above it; the waterpot at the capital is inverted with, instead of the ring, an *amalaka* [The *amalaka* is the medicinal or lucky berry of the *Phyllanthus emblica* which when half dry shrivels into grooves.] resembling a cogwheel and over the wheel the plate capital. [The details of the pillars are, beginning from the foot, the four base plates a little over 2" each, then the circular base of the waterpot 2", the waterpot 1' 10", the eight-sided shaft 3' 8" high and 3' 9" round. The distance between the pillars is 4'.] The front of the veranda is plain without any ornament. About seventy feet to the left of cave I. and at about the same level, are the remains of three cells with a broken veranda, apparently a dwelling with three cells.

Cave II.

Cave II. was intended to be a *chaitya* or chapel cave, but as a slit near the ceiling of the present back wall admitted water, the idea of making it a chapel seems to have been abandoned. To catch the water a small cistern has been cut at the left end of the back wall. The cave has an inner hall and a veranda. The hall is 33' 9" deep and varies in breadth from 13' 6" in the back to 11' in front. The left wall is rather slanting, and juts out a little into the hall. The floor of the hall is even, and almost on the same level as the veranda. The ceiling is rough and uneven, varying in height and averaging eleven feet. The quadrangular block, which seems to have been cut from the rock to make the relic-shrine or *daghoba*, is 7' deep and 8' 6" broad and rises to the ceiling. Behind it is a passage 3' 7" wide at the back and about 2' on the sides. The flaw in the back wall admitting water appears to have stopped the attempt to carve a relic-shrine. The mass of

rock seems to have been left rough and some time later a sitting female image which is not quite finished and seems to be of considerable age has been carved on the front of the rock. The figure sits cross-legged and its hands and middle are unfinished. It wears large anklets and a necklace with an end hanging like a bunch between the breasts. The ears have large earrings and a plain square crown is on the head. The doorway of the cave is about as high as the ceiling, or 10' 4" excluding the height of its threshold. It has grooves for a wooden frame. The veranda is 9' 10" broad by 4' 7" deep and 12' 9" high, or about 1' 9" higher than the hall. In front of the veranda, in a space 2' 3" deep, are two pillars and two pilasters, and between each pillar and pilaster is a foot high bench with a foot high curtain. On the back of the curtain is the rail pattern. The pillars and pilasters have not the pot and plate capital below but their top ornament differs little from that of the pillars of cave I- consisting of an octagonal shaft with upon it an inverted pot surmounted by a plain ring on which are four plates each larger than the plate below it. A new feature in these pillars is that the narrow eave of the ceiling does not rest on the pillar capital but on a quadrangular shaft over the capital. The cave seems to have been painted. The coating of plaster is still distinct in the ceiling of the hall and still more in the roof of veranda, where the colour remains. The ornament seems to have consisted of round circles between square panels, and the colours used appear to have been red yellow and white. The work appears to have been very poor. As at the Kanheri caves in Salsette, the plaster seems to have consisted of rice chaff and clay. The cave front or facade occupies a space 20' broad by 40' high in which the cave has been cut. Outside the veranda is the eave in which appear the ends of mortices. Over the eave is the rail pattern, and above the rail pattern in a recess is a round arch, and, within the arch, a deep inner arch. Steps, which apparently led between the pillars have disappeared. Two or three steps also seem to have led to a flat space which communicated by a doorway with cave III. Over this doorway is an inscription of two whole and a portion of a third line. Except the beginning and some traces of the end letters on the right the letters have been lost from the flow of water from above. The first line had twenty letters, the second twenty and the third eleven of which seven remain. The part preserved reads:

Inscription 1.

(1) Sidham upa'sakasa nagama (sa).

(2) Satamalaputasa.

(3) Fata Virabhutina.

This seems to record a gift by a merchant whose name cannot be made out. Perhaps the giver is the Virabhuti mentioned in the third line. Whether the gift was the doorway or cave II. or cave III. cannot be determined. It is probably connected with the chapel cave II.

Cave III.

Cave III. is in two parts, an inner hall and a veranda. The hall is about 18' broad by 15' deep and 7' high. The walls are not equal in length, the left wall being 15' 10" and the right wall 14' 10". In the back it is 18' 5" broad and in front 17' 3". To the right, along the entire length of the wall, is a bench 10" high and 2' 3" broad. The doorway is as high as the hall ceiling that is 7' by 4' 10" broad, and with grooves for a wooden frame. The front veranda, which is 16' 8" broad by 4' 10" deep and 10' 3" high or about 2' 9" higher than the hall roof, is on a 6" lower level than the hall floor. In the left wall a partly broken door opens on cave II. In front were two plain octagonal pillars and two pilasters. The right pilaster is entire and part of the left pillar hangs from the ceiling. This cave differs in shape both from dwellings and from chapel caves. It has no object of worship, the bench on the left is larger than a dwelling cave bench, and there are no holes above the bench for the usual cloth-pegs. The cave was probably a dining hall or *sattrā* though dining halls generally have benches on all sides instead of, as here, only on one. side. To the right of Cave III. is an earth-filled cistern, and beyond it, to the right, seems a trace of another cistern.

Cave IV.

Cave IV. about thirty feet below cave III. reached by a broken and difficult path, is an unfinished dwelling intended to have a veranda and cell. The fear of water, from cracks in the veranda roof, has left the cell unfinished with a depth and breadth of about 6' 6" and a height of about 6'. The doorway is 3' wide and is as high as the cell. The veranda is 20' 9" broad by 6' 3" deep and 1' higher than the cell. In front were two plain quadrangular pillars and two pilasters. The left pillar and pilaster remain but the whole of the right pillar and about half of the right pilaster are lost.

Cave V.

Cave V. about sixty feet to the right of cave IV. and on the same level, is not a cave but an artificial opening 26' 4" broad by 12' 8" deep much filled with earth. It may either be a view place or a large cistern of the style of a bathing cistern. Above Cave V. is a similar smaller opening. Above caves IV. and V. and about 70' to the right of Cave III. on a high level, were four cisterns, three of which have broken fronts and look like cells. The first is filled with earth and has a large *pipal* tree growing in front of it. To the right of the front enough of the work remains to leave no doubt that it was a cistern. The second cistern about twenty feet to the right is on a lower level. It is a larger cistern with a broken front and a recess at its mouth with a small bench. In the back wall of the recess is a well cut and well preserved inscription which reads:

Inscription 2.

Sivasamaputasa Sivabhutino deyadhamma podhi.

This may be translated

The meritorious gift of a cistern by Sivabhuti son of Sivasama.'

The recess seems to have been used as a cell and a doorway in its right wall leads to the third cistern which is a little larger than the second but not so deep. Its front also is broken. To the right, on the top, part of the mouth remains. A little to the right of the third is the fourth cistern filled with earth and hidden by a *Ficus glomerata* or *audumbar* tree.

Cave VI.

Cave VI. is a sitting rest-chamber, which is called a *mandap* or pleasure seat in Inscription 3. It is a recess 9' 10" broad by 4' 10" deep and 6' 8" high, with on three sides the remains of a bench 1' broad by 1' high. To the right a recess probably contained the mouth of a cistern for the use of monks resting in the *mandap*. On the right wall just under the ceiling is an important well cut inscription in three lines. Two or three letters in the beginning of each line are lost; the rest are well preserved. The inscription reads:

Inscription 3,

(1) [Rano] [The letters *rano* are entirely lost. Looking at the size of the line and of the way in which Nahapana is mentioned in Nasik inscriptions, the two missing letters are without doubt *rano*.] Maha'khatapasa [For *maha* the text has *maha* probably a mistake of the engraver.] Sa'mi Nahapa'nasa

(2) [a'] [A is half lost and the half that remains is very indistinct. The letters *matya* are dim but not doubtful.] ma'tyasa Vachhasagotasa Ayamasa

(3) deyadhama [*De* is entirely lost but as the letters *yadhama* follow though dim, *de* seems to be the probable letter.] chadhi [*Chadhi* is a mistake for *podhi*. The cistern near the cave leaves no doubt that a cistern was meant in the inscription,] matapocha punathayavasa [*Vasa* should be *vase*.] 46 kato

and it may be translated

'The meritorious gift of a mandapa and cistern by Ayama of the Vatsa stock, prime minister to the king, the great Satrapa, the lord Nahapa'na, made for merit in the year. 46.'

Cave VII.

Cave VII. is a small dwelling including a cell and a small open front. The cell is 7' square and 7' high, the front wall 3" less in breadth than the back wall. The doorway which is as high as the cell is 2' 8" broad, and has no grooves for a wooden frame. The open front is 7' 2" broad and 1' 7" deep. Its floor is nearly on the same level as the cell, perhaps an inch lower while the roof of the front is about one inch higher than the cell.

Cave VIII.

Cave VIII. is an irregular row of seven cells. In front is a space with a greatest breadth of 10" 8" in the middle and narrowing at the ends. The cells have a broken overhanging roof

with a greatest breadth of 5', narrowing towards the right, the effect of time. By the side of the first four doorways, in the front wall just under the ceiling, are niches of unknown use about 6" deep and 6" broad. All are dwelling cells as the front and back wall of each has a hole for the pole from which hung the monk's cloth and bowl.

Cave IX

Cave IX. about thirty feet below cave VIII. is a hall with a front. Its sides are irregular, with a greatest depth of 15' 6", and a breadth of 23' 9". The height is 6' 3", but as the floor is about 1' 9" deep in clay, the original height must have been about 8'. The front wall, which has doors, is smaller than the back wall being 19' 5". The right wall is 13' 8' and narrows towards the front to avoid a slit in the rock likely to admit water. The left wall is 15' 6" long. On the right side, running along the entire length of the wall, is a broken bench about 1' 9' high and with a greatest breadth of three feet. In the front wall are two doorways the left door smaller than the right. The overhanging roof of the front space is so broken that it does not look like a front, but the walls on either side are preserved. It is 19' 2" broad by 4', deep. This cave was probably a dining hall or *sattra* as its general plan much resembles that of cave III. About twelve feet to the left is a recess, either a ruined cistern or an unfinished cistern. Between caves VIII. and IX. and about fifty-five feet to the right, a group of cisterns are cut to catch a spring which flows from the hill-top. The first two cisterns, which are side by side, look like recesses and, as their partition wall is broken, they look like a two-celled dwelling. Of the first cistern the front is preserved, and traces show that its mouth was near the left end. Of the second cistern nearly half the front is gone. A little to the right of the second cistern in a recess is the third cistern, its front partly broken. To the right of the third cistern was a rock-cut seat now broken. Further to the right are four other cisterns entirely filled with earth. Above these appear to be some excavations, perhaps cisterns. now inaccessible. About fifteen feet further is an excavation like cave V. It may be a seat or perhaps a large-mouthed bathing pond. Above this are what appear to be four earth-filled cisterns recognizable only by the grass or brushwood growing out of their mouths.

Cave X.

About eighty yards to the right of this group of cisterns, near where the direction of the hill begins to change, is Cave X. The cave faces east-north-east and includes an unfinished dwelling with a cell and veranda. The veranda is finished and the inner cell incomplete, but apparently not from any flaw in the rock. The irregularly round cell is 2' 10" deep. This is the last cave in the Bhimashankar group. Above it is an excavation difficult of access which looks natural though it is artificial.

About fifteen feet to the right of cave X. near one another are five small excavations like cave V. As they are partly filled it is hard to make out whether they are view seats, large open bathing cisterns with broken front walls, or broken cells.

Ambika Group.

About 300 yards from cave X. comes the Ambika group of nineteen caves stretching from east-south-east to west-north-west, and generally facing north-north-east. About forty feet above where the group begins are seven cisterns, two of which hold good water.

Cave XI.

Cave XI., a small dwelling cave, appears to have included a cell with a front veranda. The front wall of the cell and the right and left sides and the roof of the veranda are all broken. The cell, which is 8' 2" deep and 7' 8" broad, is almost entirely filled with earth. To the left are traces of an excavation. But it is entirely filled with earth and blocked by a rock fallen from above.

Cave XII.

Cave XII. close to cave XI. is an unfinished dwelling cave, including two unfinished cells and a veranda. The veranda is finished but the cells are incomplete, especially the right cell. Both sides of the veranda are broken. Like cave XI. it is nearly half full of earth.

Cave XIII.

Cave XIII. consists of a cell and a veranda. The cell is 15' 7" broad by 7' 6" deep with irregular sides. The veranda is 7' 10" broad by 2' 10" deep. Both of its sides and a little of its front are broken. From what remains there appear to have been two quadrangular pilasters with an eave resting on them. The front of the cell is broken, but a little piece of rock hanging about the middle shows that the cave had two doorways.

Cave XIV.

Cave XIV. is a dwelling cave, consisting of a hall with two cells on either side. It is greatly broken. In the back wall of the hall is a large hole caused by a layer of soft rock. The hall is 18' 6" square and 9' high. The side cells, which are nearly equal in size, are 6" higher than the level of the hall floor. The first cell to the left is 6' 10" deep and 6' 7" broad, and the second is 6' 8" deep and 6' 10" broad; the first cell to the right is 6' 10" deep by 7' 10" broad, and the second 7' deep by 7' 8" broad. The cells have plain doorways 7' 5" high. All the cells are nearly 7' 5" high and their ceiling is about 1' higher than the hall ceiling. The right front wall of the hall is entire. The left front wall, though broken from below, remains in the upper part and shows that the hall door was 6' broad and as high as the hall ceiling. The hall has an open front 16' 4" broad and 5' 8" deep, as appears from the still preserved top of the left side. The right side is lost. In the back wall of the veranda and to the right of the hall doorway below the ceiling is an inscription in two lines partly broken. The inscription reads:

Inscription 4.

(1) (Ga) hapatiputanam bhatunnam donanka

(2) sa chaugabham deyadhamam.

This seems to show that the givers of this cave were two sons of a householder whose name has been lost in the beginning of the first line. The names of the sons also are lost in the beginning of the second line. The cave is called four-celled.

Cave XV.

Cave XV. is a large cell, 12' 9" deep 12' broad and 8' high. Catch-holes in either wall seem to show that the cave has been used for cattle. Hammer marks show that an attempt has been made to break the partition walls. The door is 4' 3" broad and 8' high, and has holes in the top for a thick wooden frame. The cell had an overhanging eave.

Cave XVI

A flight of steps between caves XIV. and XV. leads to Cave XVI. The old steps have been broken and new steps have been made probably by the townspeople. An image of the Jain goddess Ambika has been carved in the cave and the image is worshipped by the Jains and other people of Junnar, and, after the name of this goddess, this group is locally known as Ambika Lene. The cave is a dwelling, consisting of five cells with a large front veranda. The cells are not cut straight and are of unequal size. Part of the back wall of the veranda beginning with the third cell and part also of the front wall are broken. The first cell is 6' 8" broad 7' 10" deep and 6' 10" high. In the back has been cut a shallow recess for an image or perhaps to make an inner cell. In the left wall is a hole for the monk's clothes-peg. The door is 2' 6" broad and as high as the ceiling. The cell floor is 3' lower than the veranda floor. To the left of the doorway, in a small shallow recess, is a standing figure of a Jain Kshetrapal or Field-Guardian, about 1' 6" high, of the tenth or eleventh century. His left hand rests on his hip and in the right hand is a weapon too broken to be identified. Round his face is an aureole. Near his right leg is a sitting human figure and near his left leg is a dog. This image has been broken probably by Musalmans. To the right of the doorway in a small recess is a broken sitting figure of a goddess 10" high, probably a figure of the Jain, goddess Chakreshvari. On either side of the image are two human figures. In front of each image is a pair of holes in which to lay a board or plank for offerings.

The second cell is 7' 8" deep by 6' 9" broad and 6' 9" high with a peg-hole in the back wall and two catch-holes high up the side walls. The third cell is unfinished because of a soft layer in the left side wall. It is 5' 10" deep by 4' 10" broad and 6' 4" high. Between the third and fourth cells is a recess, which must originally have contained the figure of a Jain god. The plinth for the seat of the god has been made as well as a drain to carry away the water of the god's bath. The fourth and fifth cells were originally separate but the Jains have broken down, the partition, a trace of which appears in the ceiling, and made the two cells into one hall 7' 10" deep by 17' 3" broad and 7' 1" high. In the back wall two Jain images sit cross-legged in the lotus position. They appear to have been broken by the Musalmans. The image to the left, probably of Neminath the twenty-second Tirthankar, is 3' high and 2' 5" in the cross-legged posture, and has a three-canopied umbrella, and, on

either side of the umbrella, a broken flying angel with a fly-flap or *chauri*. To the left in a recess were two small standing figures one 1' 3" high and the other smaller. Each figure had over the head a serpent hood, or perhaps a badly cut umbrella. The image to the right, also broken, probably by Musalmans, is perhaps of Adinath the first Jain Tirthankar, as above his shoulder are the carved ring-lets by which, in old images, Adinath is identified. The image sits cross-legged 2' 5" high and 2' 3" between the knees. Round the face is an aureole. Above is a three-canopied umbrella of somewhat different shape from the umbrella over the image of Neminath. On either side of the umbrella is an angel with a fly-flap. In the left wall of the hall, in a recess, is Ambika seated under a mango tree. The image is 2' 3" high by 2' 2" broad. The left leg is crossed and the right leg hangs down. Under the left knee is the lion, Ambika's car. Over the left and right knees are two boys, her sons Siddha and Buddha. To the left of Ambika, a standing figure 1' 4" high holds an umbrella. Above the mango trees three Tirthankars sit cross-legged, the middle figure larger than the two side figures. This is to show that the goddess Ambika is subordinate to the Tirthankars, though she is regarded as the special guardian goddess or *shasandevi* of Neminath the twenty-second Tirthankar. Under each figure are two holes probably for wooden planks. From their workmanship, these images appear to be of the tenth or eleventh century, when the Jains seem to have plastered these two cells and the veranda in front of them. Traces of the plaster, which seems to have consisted of thin hemp-like fibres mixed with lime, remain.

In front of all the cells is a broken veranda 49' 10" broad by 7' 2" deep. A wall ran along the veranda in front of caves XV. XVII. and XVIII. This wall, as well as more than half of the veranda floor, is ruined. To admit light into it, each cell appears to have had a door in the front wall, but, except the first door and the top part of the second, no traces of the doors are left.

Cave XVII

Cave XVII. is to the right of cave XV. on a two feet higher level and under cave XVI. It is a cell 7' deep by 7' 8" broad and 7' 2" high. Its back wall and left side remain, though a partly successful attempt has been made to break the left wall. The right wall is partly broken while the front wall and part of the ceiling are gone. In the back wall is a peg-hole.

Cave XVIII.

Cave XVIII. by the side of cave XVII. and under the veranda of cave XVI. consists of two cells now entirely ruined except the back wall. They are about 5' 6" in front of cave XVII.

Cave XIX.

Cave XIX. to the right of cave XVIII. and under cave XVI. appears to have consisted of a veranda and an inner cell 7' 1" deep by 7' 9" broad and 7' 10" high. Its front wall and

veranda are gone. A door in the left of this veranda probably led to the right cell of cave XVIII.

Cave XX.

Cave XX. is a small plain quadrangular chapel cave. Its floor, which is now much filled with earth, appears to have originally been on the same level as cave XXI. to its right, the great chapel of this group. Its front wall and part of the side walls are broken. The cave probably extended to the pillars of cave XXI. and was 14 deep and 9' 8" broad. The height cannot be ascertained as it is much filled with earth. The relic-shrine or *chaitya* is about two feet from the back and side walls. In shape the relic-shrine is of the time of Gotamiputra II. (A.D. 50), consisting of a toothed belt on a round plinth, the belt surmounted by a strip of rail pattern, and on the plinth a more than three quarters circular dome, and above the dome a capital with rail pattern (now broken but distinct on the back), and on the capital a broken shaft supporting an umbrella cut out of the ceiling. The dome is about 3' high. [It is possible that, like the relic-shrine to the left of Kanheri cave IV. the relic-shrine in this cave may be dedicated to some local monk. The cave could not then be called a chapel or *chaitya* cave as the word *chaitya* is only used for relic-shrines in honour of Buddha while the word for relic-shrines in honour of monks, as the Bhaja and Kanheri cave inscriptions show, is *thupa* or *stupa*.]

Cave XXI,

Cave XXI. is an unfinished chapel or *chaitya* cave intended to be the chief place of worship in the Ambika group. A large cross layer of soft rock, as high as the cave and six feet broad, which runs throughout the rock and appears in cave XIV. about sixty feet to the left, seems to be the cause why the chapel was left unfinished. In spite of this layer of soft rock the excavation seems to have been continued up to the relic-shrine, but a second layer of soft trap behind the relic-shrine seems to have stopped further work. The veranda has been finished, the hall also is mostly finished, but the relic-shrine is incomplete. The rock intended for the relic-shrine seems to have been left unfinished while being dressed; only the tee has been made and the dome appears to have been partly brought into shape. The hall is 37' 4" deep by 16' broad in front. The roof is vaulted on perpendicular walls the height of which cannot be given as the cave is greatly filled with clay washed in during the rains. The doorway is quadrangular five feet broad and apparently about ten feet high. Above is a moulding 13' 7" long and 1' 9" broad. Above the moulding is a recess in which is a horse-shoe arch, and within the arch a vaulted window admits light to the cave. In front of the door a flat-roofed veranda has two pillars and two pilasters in the Shatakarni (B. C. 90- A.D. 300) style with a central octagonal shaft on an Indian waterpot resting on a ring over four square plates, each plate smaller than the one below it. Above the shaft are the pot and the plates inverted, with, over the plates, a quadrangular shaft on which as in cave II. rests the eave of the roof. The left pilaster is lost. The chief interest of this cave are eleven inscriptions in the veranda, many of them recording grants, but none referring to the making of the cave. The grants do not seem to refer to this unfinished *chaitya* cave but to the monastic establishment which lived in the Ambika group. This cave seems to have been chosen for recording grants because it was empty and unused

The inscriptions are badly cut on a rough undressed surface, but though a little hard to read, most are complete.

Inscription 5.

Inscription 5 is on the right hand pillar in two parts, one on a face to the left of the visitor and the other on the right face. It is hard to say, until the meaning is made out, whether this is one inscription in two parts or two separate inscriptions. The letters are distinct, deep-cut, and well preserved, but no meaning can be got out of them. The inscription seems to be in a foreign language written in cave characters. The inscription is in two parts, the first of which may be read:

- | | |
|--------------------------|-----------------------------|
| (1) Apura'na | (5) Va'dhima'. ² |
| (2) Deaka'. ¹ | (6) Nikava. ³ |
| (3) Hamana'. | (7) Vancha ⁴ |
| (4) Roathi. | |

¹*Deaka* may be also read *desuka*.

²The letter *ma* is confused by a crack in the rock; it may perhaps be *va* or *mi*.]

³*Nikava* may be *nikacha*.

⁴*Vancha* may be also read *voncha* or *choncha*.

The second part may be read

- (1) Asa. [*Asa* may be *musa*.] (2) Tha'da. (3) Khunesa. [*Khunesa* may be *rinesa*.] (4) Ma.
[The small cross line after *an* marks that the writing is complete.]

Inscription 6.

Inscription 6 is on the left pillar on the side facing the inscribed faces of the right pillar. It is in four distinct and well cut lines. As in Inscription 5 no meaning can be made out of the words which are:

- (1) Ta'bake. [*Tabake* may be *nabake*.] (2) Keausa. [*Kesusa* may be *keasa*.] (3) Ta'tobho.
[The middle letter *to* of *tatobho* may be an engraver's mistake for *chho*.] (4) Badhi. [*Badhi* may be *gadhi* or *sadhi*.]

Inscription 7.

Inscription 7 is in the back wall of the veranda to the left of the moulding on the doorway. The inscription is in four lines faintly cut on a rough surface but distinct. The inscription reads:

(1) Ga'meshu [The third letter *shu* appears like *pa* in the original as the letters are very nearly alike. It is curious to find *shu* here as the letter *sha* is not generally used in Prakrit.]
va'nadeshu [The letter *shu* at the end is also written like *up* but to read *up* makes no sense.] nivatana'ni

(2) panarasasa [Compare below *aparajita* in Inscription 10.] palapasa

(3) deyadhama apajitesuga

(4) nepayogokahathe da'na- [*Dana* in the original looks like *nana*. It is probably an engraver's mistake as, the first letter must be *da*.]

This records the grant by a man named Palapa of fifteen *nivar-tanas* in Vanada village to remain in charge of a man named Payogoka of the Apajita *gana* or sect. Vanada village may be the modern Vanavdi four miles west of Junnar. Apajita must be a Buddhist sect. The Jains also have *ganas*, one very old sect among the Digambaras is Aparajita which this name closely resembles. [Compare below *aparajita* in Inscription 10.]

Inscription 8.

Inscription 8 on the moulding consists of four long lines on a rough surface, the letters getting larger in each lower line. As the surface is rough and full of irregular chisel marks crossing the letters the inscription is hard to read and is puzzling. It may be read:

(1). Gedha [*Gedha* may be *gidha*.] viha'ra'na [The lower part of *ra* is much curved and appears like *ad* but it must be *na*. *Na* ought to be *nam*.] da'na [The original has *dana* probably for *dana*. A chisel mark below *na* makes it look like *ku* but *daku* gives no sense, while examination shows that the roughness in the rock has no connection with the letter.] ka'ka (pu) teta [*Pu* seems to have been omitted after *kaka* and before *teta* for Sk. *Kakaputrena*. This appears to be the name of some place in Junnar, as, at the end, mention is made of a gift of eight *nivatanas* to the *Kakaputiya samaya* or the assemblage residing in *Kakaputa*.] sa'rasavano na'ma vannakaro iya hala'panasa'ya [*Panasaya* is a mistake probably for *pannasaya*.] bhoga deyadhama suvanaka'ra seniya.

(2) Ga'ma Danagara khetramha' chheta ha [The *ha* after *chheta* is hard to understand. It seems to be unconnected with the sentence. If it is taken as a numeral it might represent eight. Still this cannot be right as the attribute *savajatabhogam* is in the singular number and as the figure for eight which occurs in the last line of the inscription is different.] (?) savaja'(ta) bhogam [The *ta* after *savaja* has been omitted probably by the engraver. Without supplying a *ta* the phrase gives no meaning, and the phrase *savajatabhogam* occurs in the Nasik inscriptions. Bombay Gazetteer, XVI. pp. 551, 552 note 2.] nivatana'ni be2 [For *be 2* the original seems to have something like *pota*; it is a mistake of the engraver as the letters *pota* and *be 2* are much alike.] deyadhama simita'ya game panakavachhare hala'to karo bha'takasa deyadhama.

(3). Ga'me madahatalesu [Le looks like *pe* as the letters are very closely alike; but as the *matra* is on the second stroke and not on the first, *le* is better. The middle stroke in *su* appears to be a mistake of the engraver. With the stroke the mark cannot be made out as any letter.] chhetasu lonikamato bha'go satesu panchasu deyadhama simita'ya ola'nathiya a'baka' nivatana'ni be.

(4). Deyadhama va'niyikasa Da'manadasa.

(5). Ga'me kisiravalava'yam kheta Viratha'na gharasa puva [pa] se nivatana'ni atha 8 Ka'kaputiya sama'ya

(6). Mhi.....deyadhama.

This records gifts in different places by different men to the Gidha Vihara which would seem to show that this group used to be called the Gidha Vihara. The first gift of the duty on fifty ploughs [It was an old custom for every village to have a permanent officer named Gramakuta to distribute ploughs to cultivators and levy a duty upon them (Vatsyana's Kamasutra, chapter V.). It is to this duty that reference is here made.] is by a dyer named Sarasvana residing in Kakaputa. As *ata* here is used with Kakaputa it appears that Kakaputa is the name of some place near Junnar where the dyer lived. The second gift is by a guild of goldsmiths of two *nivatanas* in a field in Danagara village. This Danagara village may be Dhangarvadi village five miles south-west of Junnar, if the place Dhangarvadi be not a modern name called after Dhangars. The third gift is by a woman named Simita (Sk. Srimitra) of the rent and duty on ploughs in Panakavachhara village. This Panakavachhara may be the modern Pansarvadi two miles north of Junnar. The suffix *vadi* is modern and generally used to mean a small village while the name *Panasara* or Pansar, must have been derived from the corrupt form *pana avasara*. The fourth gift must be by the same Simita as the name of the giver is not mentioned. The fifth gift is by the same Simita, of two *nivatanas* of mango groves in Olana village. This Olana village may be Valangaon village seven miles south-east of Junnar. The sixth gift is of a field of 8 *nivatanas* in Kisirvalava village to the east of Virthanghara. Kisirvalava may be the modern Kusur village two miles west of Junnar. All these six grants have been made to the Kakaputiya assemblage. This seems to show that Kakaputa is the name of some place near Junnar.

Inscription 9.

Inscription 9 is in nine lines in the veranda recess to the left of the horse-shoe arch. It is faintly cut on a rough surface. It is complete and well preserved. The inscription may be read:

(1). Kona'chike seniya

(2). Uvasako A'duthuma

(3). Sako Vada'lika'yam

(4). Karanja mula nivatana

(5). nivisa Kataputake

(6). vadamule nivata

(7). na'nide. [This letter *de* is much spoilt but is probably for Sk. *dve*. It may perhaps be *va na* being the preceding letter omitted in the vacant space after in]

This is a grant by one Aduthuma of the Saaka tribe, probably a Parthian Greek convert to Buddhism as he calls himself an *uvasaka* (Sk. *upasaka*) or devotee. The name of his guild is Konachika, a profession which cannot be made out. The grant is of twenty Nivatanas near *karanj* or Pongamia glabra trees in Vadalika and of two Nivatanas near banian trees in Kataputaka.

Inscription 10.

Inscription 10 is in the veranda recess in the back wall to the left of the great horse-shoe arch. It consists of ten lines of which the last cannot be made out. It is cut on a rough surface and care has to be taken both in taking facsimiles and in deciphering as chisel marks greatly confuse the letters. The inscription may be read:

(1). Maha'veje game ja'babhati

(2). udesena nivatana ni shanuvisa

(3). sidhagane Apra'jite

(4) narasatani [*Narasatani* appears to be a mistake for *nirasatani* (Sk. *nirastani*).] serasa

(5). Ma'namukudasa purato

(6). Talakava'dake nivata

(7). na'ni tini ll nagarasa.

(8). ka..... di..... sela ude

(9). sena nivata'ni ve.

(10)

Inscription 11.

This records three grants, the first of twenty-six Nivatanas in Mahaveja village for Javabhati [The name of the donor is not given in the inscription. The grant is said to have

been made for the merit of Javabhāti. The name Javabhāti is unusual.] to the Sidhagana or community of the Aparajita sect. No village named Mahaveja near Junnar can be traced. The second grant is of three Nivatanaś at the foot of Manamukuda hill. As there is no particular mention of the person who gives or for whom the grant is made, it is probable that it is made by the same person who made the first grant. Manamukuda (Sk. Manamukuda) must be the old name of the hill which is still called Manmoda. The third grant is of two Nivatanaś for this hill by a donor of the city whose name is lost.

Inscription 11 is on the left side of the front face of the horseshoe arch. It is in nine small lines, well carved and distinct, and may be read:

(1)A'bi, (2)Ka'tati,[*Katati* may be *Kabhāti*.] (3) Nivata, (4)Na'ni, (5)Va'hata,
(6). Vacheru, [*Vacheru* may be *Vakharu*,] (7)Kasa, (8)Esa, (9). Da nam.

This inscription records the grant of 10 Nivatanaś of mango groves by one Vacheru a Vahata. Vahata seems to be a surname.

Inscription 12 is a modern Persian inscription on the front right face of the inner arch. It records the name Mahammad Ali, a name which is also recorded in another Junnar cave but without the date. The date here given is Hijri 988 that is A.D. 1580. It is; probably the name of a visitor.

Inscription 13.

Inscription 13 is on the right side of the front face of the great horse-shoe arch. It is in three lines written lengthwise. It is faintly cut on a rough surface and may be read:

(1) Seniye Vasaka'rasa [*Vasakarasa* may be *vesakarasa* or *tesakarasa*. It is probably *vasakar* (Sk. *vansakara*).]

(2). ma'se pa'donaduke

(3). Ka'saka'resu seniyapa'da e[ka]sa. [The original has *padeesa*. *Ka* is probably omitted, which, if supplied, would read *pade ekasa* for Sk. *padaikasya*.]

This records the grant of one and three quarters by a guild of bamboo makers; and another of one quarter by a guild of coppersmiths. The thing granted is not named. It is probably the current coin of the country which the two guilds must have agreed to pay monthly. It is difficult to understand how a guild like that of coppersmiths, who are generally better off than bamboomakers, should make a grant of only $\frac{1}{4}$ or $1\frac{1}{2}$ less than the bamboomakers' guild. Perhaps *sapada eka* or $1\frac{1}{4}$ is meant to be written for *pada e(ka)sa*.

Inscription 14.

Inscription 14 is in the back wall of the veranda recess to the right of the horse-shoe arch. It is in six lines cut on a rough surface and the letters are much confused with chisel marks. The last two lines are much defaced and are hard to read. The sixth line appears to have some letters like *bhogani* (for Sk. *bhogyani*) but they are indistinct and doubtful. The inscription may be read:

(1). Ga'me Vala nakesu [There is a stroke on *na* the third letter which is probably a chisel mark. If it has any connection with the letter, *na* should be read *ha*.] kara

(2). jabhati udesena nivata

(3). *nani* barasa ga'mese

(4). urakesu nivatana'ni

(5)

(6)

This appears to record two grants and perhaps a third which is lost in the defaced lines. The first is a grant of 12 Nivatanas in Valana(ha?)ka village for the merit of one Karanjbhati. This name is as unusual as Javabhati in Inscription 10. The second grant is of (number lost) Nivatanas in Seuraka village. This grant also appears to be for the merit of Karanjbhati. Seuraka is probably the modern Savargaon about six miles west of Junnar.

Inscription 15.

Inscription 15 is in the right hand wall of the veranda recess It is faintly cut on a very rough surface and chisel marks greatly confuse the letters. Some lines in the middle are doubtful and in some places letters can hardly be distinguished from chisel marks. The inscription may be read:

(1). Avarile va sarita. [*Saritadake* may be *sarikhadake*.]

(2). dake nivatanani cha,

(3). Tarill

(4).Ararilesu,

(5).Kenivatana'ni.

(6).

(7). Avarile jibubhu

(8). tika [Jibubhutika may be also read jiputraka as *bu* is a letter much like *pu* and *bhu* is much like *tra* and the letter *ti* is doubtful, perhaps a chisel mark.] udesena nivata.

(9). na'ni atha ga'me ka

(10). dakesu nivatana'ni

(11). ba'ra deya.

This inscription records the grants of Nivatanas in various villages.

Cave XXII.

Cave XXII. is close to the right of cave XXI. It is a dwelling for monks and is well made. It consists of two cells with a veranda. On either side of each doorway is a pilaster and in the corner are pilasters on which rests the beam. The left cell is 8' deep and 7' broad with a grooved doorway 2' 3" broad. The right cell is 7' 9" deep by 7' broad with a doorway 2' 3" broad. Within each cell in the back and front walls are holes for the monk's pole. The veranda is 15' broad and 5' 10" deep with a ceiling about 7" higher than the cell ceiling. Its side walls and front are gone. As the cave is nearly half filled with earth, its height cannot be given.

Inscription 16.

In the back wall of the veranda between the two doorways is Inscription 16, well cut on a dressed surface and well preserved. It is in two lines with, between them, a short line of small letters recording the name of the giver's father which was at first omitted. Above the inscription are some chisel marks showing that an attempt was made to break the wall in search of treasure. The inscription may be read:

(1) Bha'rukachhaka'nam lankudiya'nam bha'tunam

(2). Asasamasa putana

(3). Budhamitasa Budharakhitasa cha bigabham deyadhammam.

In the beginning of the first line is the *svastika* symbol. The inscription records the gift of the two-celled cave by two brothers Budhamita (Sk Buddhamitra) and Budharakhita (Sk. Buddharakshita) sons of Asasama inhabitants of Broach in Gujarat.

Cave XXIII.

Cave XXIII. is close to cave XXII. and consists of two cells and a veranda. Both the cells are 7' 9" deep and 7' 5" broad with a doorway 2' 4" wide. In both cells are peg-holes on the front and back walls. The veranda is 15' 7" broad by 7' 4" deep. The veranda ceiling is about 1' higher than the cell ceiling. Like cave XXII. the cave is more than half filled

with earth. In the back wall of the veranda between the doorways is Inscription 17 in two lines faintly cut on a dressed surface. The letters are distinct. The inscription may be read:

Inscription 17.

(1) Sayitigahapatiputasa gahapatisa Sivadasasa bitiyikaya

(2). cha saha pariva'. [After *va* the surface is dressed for about ten letters but there is no writing. The remaining letters must be *rasa bigabham* deyadhammam.]

This records the gift of a two-celled dwelling by the householder Sivadasa a son of the householder Sayiti, his wife and family.

Cave XXIV.

Cave XXIV. close to the right of cave XXIII. is a dwelling of which only the veranda has been finished. There appear to have been two pillars and two pilasters with the roof beam resting on them. The pillars are broken, and the left pilaster is half finished. From the upper capital they appear to be of the usual Satakarni style. The cave has been left unfinished, because in the right hand corner is the same layer of soft stone which shows in the middle of the great chapel cave XXI. The veranda is 18' 2" broad by about 6' 3" deep. Outside the veranda in front, to the left of the left pilaster, is Inscription 18 in ten lines. It is very well cut on a dressed surface. Like the Kuda cave inscriptions the *ikaras* are rounded and serpentine. In the beginning of the first line of the inscription is the Buddhist trident and the *svastika* symbol comes at the end of the last line. The inscription may be read:

Inscription 18.

(1). Gana' chariya'nam thera'nam bha

(2). yanta Sulasa'nam tevija'

(3). nam anteva'sinam thera'nam bha

(4). yanta chetiyasa'nam tevi

(5). ja'nam nandanamkana vaka

(6). ankothalaki [The *an* of *amkothalaki* seems to have a dim letter like *pa* before it, the *pa* and *on*, being probably connected with the last letters. After *ah kothalaki* is distinct and the first two letters in the beginning of line 7 must be *yunam*, *kothalakiyanam* being probably an attribute of *gahapati* whose name is lost.

After *yanam dha* seems to follow after one lost letter. This lost letter is probably *va*, the two letters together being *vadha* (Sk. *vridhha*, old) meaning the old (in age) Gahapati of

Kothalaki or the respected Gahapati, or perhaps *Vadha* is a proper name. The ninth line is lost, but from the fragments of letters that are left the first and second letters appear to be *sa* whose two top strokes remain. The vacant space for the next letter must have contained *pa*, as the *ikara* of *ri* the next letter follows; after *ri* the lost letter must be *va* and after *va* the two top strokes of *sa* still appear.]

(7) ya'nam (Vu) dhagahapati

(8). natuno Nandanaka

(9). (sa pariva'rasa)

(10). deyadhamam.

This inscription shows that it was not the custom to cut the; inscription only after the cave was finished but as soon as work was begun and a proper place for an inscription was available. The inscription records a gift (probably of this cave) by Nandanaka the grandson of Vadha (?) Gahapati of the Kothalki family. In the beginning of the inscription something is mentioned about a Sthavira but the connection between the two parts cannot be made out on account of the break in the sixth line. The Sthavira is the Reverend Chaitya who is called a Tevija (Sk. Traividya) and a disciple of the Reverend Sulasa also a Tevija and *acharya* of the *ganas* or preceptor of sects.

Cave XXV.

Cave XXV. to the right of cave XXIV. on a rather higher level is an unfinished veranda with two plain pillars and pilasters in front. Above the pillars, in front of the ceiling, are imitations of wooden mortices, and above the mortices is the rail pattern. The breadth of the unfinished veranda is 15' 2" and depth 4'. There is nothing important in the cave Caves XXVI. XXVII. and XXVIII. are in a row about thirty feet above cave XXIV. They are numbered from right to left. The way to them is difficult.

Cave XXVI.

Cave XXVI. about thirty feet above cave XXV. is much like it, being a veranda with two pillars and two pilasters. The only peculiar points are two benches, on the right and left, of the length of the side walls, as broad as the pilasters and about a foot high. A piece of rock near the left bench remains unworked, and so, also, does the top of the right wall near the ceiling. The pillars also are not dressed. It is nearly finished and the back wall is well dressed, as it would not have been if it were intended to cut further in. It is 15' 4" broad with a greatest depth of 5' 3" and a height of 8'. This and cave XXV. are not dwellings but thought or view seats as they are on a high level with a fine view of the city and the distant hills. To the right of this, at a little distance, is a cistern.

Cave XXVII.

Cave XXVII. is a dwelling consisting of two cells with a recess- like veranda. The cell to the left is about 10' deep and 10' 5" broad. The right and left walls are unequal in size and the ceiling is 7' 3" high. A hole in the right wall leads to the right cell. The doorway is 3' 5" wide and as high as the ceiling, and has holes for fixing the wooden door frame. The right cell is 11' 9" deep by 11' 2" broad and 7' 7" high with a door nearly equal in breadth to the first, with holes for fixing the wooden door frame. On the right side of both cells are holes in the back and front wall for the monk's pole. The veranda is 25' broad and 3' deep. Part of the side is broken.

Cave XXVIII.

Cave XXVIII. about twenty-five feet to the left of cave XXVII. and on a slightly lower level, is a small dwelling including a cell and a small veranda in front. The cave is half filled with earth. The cell is 7' 11' deep by 7' 8" broad with a doorway 2' 8" broad. The veranda is 7' 5" broad and 4' deep. Most of the ceiling is broken.

Cave XXIX.

About eighty yards to the right of cave XXIV. near a fine mango tree, are three cisterns each on a slightly lower level than the other, the lowest containing water. To the right of the lowest is a roughly cut walk, and to the right of the walk are three cisterns filled with clay.

About ninety yards from the three cisterns, on a higher level, are two other cisterns and above the cisterns on a still higher level to the right is cave XXIX. Like caves XXV. and XXVI. it is an unfinished view seat 15' 6" broad and 3' deep with irregular walls. In front are two pillars and pilasters.

About 150 yards further, to the right of cave XXIX. and on about the same level, are four excavations which look like cells. They are all cisterns and look like cells because their fronts have broken away.

Bhutling Group.

About 200 yards to the right, on a higher level than the two previous groups, comes the third Manmoda group called Bhutling by the people. This group goes from south-cast to north-west and generally faces north-east. It is numbered in continuation of the Ambika group beginning from left to right.

Cave XXX.

Cave XXX. the first to the left in this row is a very unfinished dwelling of no special interest. It appears to have been left unfinished on account of water coming from above. The cell is much filled with earth. To the right are three earth-filled cisterns.

Cave XXXI.

Just after the three cisterns comes Cave XXXI. a dwelling consisting of a cell 11' 4" deep by 7' 7" broad, with its doorway 2' 10" broad, and holes for a wooden frame. The height of the cell is about 6' 5" About 1' 2" under the ceiling, on the right and left side walls, are three holes in each wall facing one another.

About eighteen feet above cave XXXI. appears something like a recess but it is inaccessible. To the right of cave XXXI. and on the same level are three cisterns buried in earth and brushwood.

Cave XXXII.

Cave XXXII. is a large four-celled or *chaugabbha* dwelling with two cells in the back wall and two in the left wall. It is in bad order. It is partly filled with earth. The hall is 18' square and 7' 8" high or, leaving 1' 4" for the earth, about 9' high. The first cell on the left side is 7' 8" broad by 7' 10" deep with a broken doorway, and the second cell 7' 6" deep by 7' 3" broad. The left cell in the back wall is 7' 5" square with a doorway 2' 3" broad and the right cell is 7' 6" deep by 7' 9" broad. To the right and along the back are benches with the ceiling over them about 1' lower than the rest. The right bench is 2' 5" broad and 2' 9" high and as long as the wall, and the back bench 2' broad 4' 4" long and 2' 6" high. Except the doorway of the right back wall cell, all the other doorways have grooves for fixing wooden frames. There are holes in the right and left walls of all the cells for the monk's pole.

Cave XXXIII.

Cave XXXIII. close to the right of cave XXXII. is a dwelling consisting of a veranda, an inner hall, and cells. It is much, broken and much filled with earth. The hall is 16' deep and 15' broad. To the right are three cells and to the left two, the one to the left unfinished and the right one broken. There is space for a third to the right of the second cell, but the hall is not finished. In the veranda are two cells, the left one finished and the right one unfinished. The veranda ceiling has been broken and pieces of rocks lie in the veranda. Close to the right of cave XXXIII. is an excavation, the beginning of a cell. Above caves XXXII. and XXXIII. are caves XXXIV. to XXXVII. reached by broken steps between XXXII. and XXXIII

Cave XXXIV.

Cave XXXIV. is just above cave XXXII. It is a dwelling consisting of a plain veranda with four cells in the back wall in one row. All are of the same height and their ceilings are about 1' higher than the veranda ceilings. They are partly filled with earth. The first cell beginning with the left is 7' 3" broad and 7' deep with a doorway 2' 2" wide; the second is 7' 1" broad and 7' deep with a doorway 2' 5" wide; and the third is 7' 2" square with the right side of the doorway broken. The fourth cell is above cave XXXV. Its floor has been broken probably in later times as an easy entrance to the other cells. It is 7' 4" square with a doorway 2' 4" wide. All the doorways have grooves for fixing a wooden frame, and each of the first three cells has holes for the monk's pole. The veranda is plain

34' 5" broad and 5' deep. Part of the roof front is broken but it appears to have had no pillars in front. At the right end of the veranda is an open cell, probably a seat for monks.

Cave XXXV.

Cave XXXV. is a dwelling under the fourth cell and the veranda seat of cave XXXIV. It is in three parts, a veranda, a middle room, and a cell in the back wall. The veranda and room are separated by two plain side pilasters and a rock beam above. The inner cell is unfinished, but the middle room and veranda are well finished. The veranda is 6' 10" broad by 6' deep and 6' high; the middle room 5' 3" broad and 2' 9" deep and 6' 3" high; and the inner cell 4' 10" broad and 4' 6" deep. The ceilings of the middle room and veranda, which are the floors of the fourth cell and the veranda seat of cave XXXIV. are broken.

Cave XXXVI.

Cave XXXVI. is close to the right of cave XXXV. and on about the same level. It is a dwelling consisting of a plain veranda and four cells in the front wall. On the doorway of each cell are horseshoe arches supported on stone imitations of wooden arches. Between the arches is the rail pattern supporting thin stone imitations of wooden mortices whose ends appear under the rail pattern. Above the rail pattern is a semicircular *daghoba* or relic-shrine on each side of each arch. Above the *daghoba* is a five-plate capital and above the plates an umbrella. On the same level as the capital, and above the arch on either side, small arches of the same shape as the big arch rest on the rail pattern. Above again is the rail pattern. [The mortices are not cut in the first cell.] On the front face of the first arch is a pattern in leaf and flower which is also found on the arch of a cell of one of the Udayagiri caves in Orissa. The other arch front faces are plain. Under the arches in the front wall, above the doorway, the carving in varying patterns partly resembles that in the *chaitya* cave III. at Nasik. The first, between arched lattice work on either side has the Buddhist wheel resting on a lotus; the second in the middle has a Buddhist trident and above the trident the pentagonal symbol so common in Buddhist architecture; the third has only the pentagonal symbol, and the fourth has plain arched lattice work. To the left, in the veranda, is a beautiful Buddhist wheel with beautifully carved Buddhist tridents in the rim and a lion between the spokes. The wheel is broken, only a portion on the right is left. It probably rested on a pillar of which a trace appears on the floor. The right wall of the veranda is broken; it probably had a lion resting on a pillar. The first cell is 7' 4" broad 7' 4" deep and 6' 10" high with a doorway 5' high and 2' wide; the second 7' 8" broad by 7' 6" deep and 6' 6" high with a doorway 5' 9" high by 2' wide; the third 7' 3" broad by 7' 3" deep and 7' 2" high with a doorway 5' 9" high and 2' wide; and the fourth 6' 4" broad by 7' 3" deep and 6' 2" high with a doorway 2' wide. Except the third all the cells have holes for fixing wooden frames and the third has grooves for hinges. All the cells have on the right side two holes in the front and back walls for the monk's pole. The right walls of the third and fourth cells are broken, and, as appears from traces of hammer strokes, attempts were also made to break the right walls of the first and second cells. The veranda is 29' broad and about 4' 3" deep. In the front wall, between the second and third cells, is inscribed the name Mahammad Ali with the date H. 988 that is A.D. 1580.

Cave XXXVII.

Cave XXXVII. close to the right of cave XXXVI. is a cell 8' 7" broad and 8' 5" deep with a plain doorway 2' 7" broad. Its left wall is broken and leads to the fourth cell of cave XXXVI. The left of the veranda is ruined.

Cave XXXVIII.

Cave XXXVIII. is an unfinished chapel cave, the largest in this group. It is close to the right of cave XXXVII but on a lower level the same as cave XXXV. The cave is 30' long and at the outset 12' broad with a gateway 9' 6" broad. As it is much filled with clay its height cannot be accurately stated, but it is probably about 10'. The *daghoba* or relic-shrine is eighteen feet from the gateway. In front of the gateway was a small veranda with a broken terrace. It appears to have been intended to cut on either side of the cave so as to give entrance to the aisles without passing through the gateway. The right aisle is partly finished. One pilaster and two pillars have been cut and on the left recesses have been cut to make two pillars while the passage to the left aisle has also been begun. The three pillars of the right aisle are plain octagons with the vertical wall above them, and above the wall a plain vaulted roof as in Ajanta cave X. A crack in the roof seems to have admitted; water as a large recess has been cut on the right above the gateway from where the water has been drained outside over the terrace. The relic-shrine plinth is plain and circular but it is still rough and the ornament uncarved. The dome above it is older than that of other Junnar relic-shrines. Like the domes of Gotamiputra II. (A.D, 50) it is not much rounded, but is like a bowl with a narrowing mouth., It never had a capital. Above the veranda terrace is an ornamented-; front consisting of a large arch resting on ribs the imitations of wooden rafters. Only some of the ribs are finished. Under the, arch in the back wall is the usual arched window and above the' window a semicircle shaped like a half lotus, the middle of which; represents the calyx and the circle outside the stamen. Round the, semicircle are seven petals. The carving of the seven petals is as follows. In the middle is a standing Lakshmi. On the right is a lotus and on the left a lotus leaf. Lakshmi wears a cloth like a waistcloth and in her ears are large ear-ornaments. Her left hand; rests on her hip and her right is raised in blessing. In the side petals elephants, standing on lotuses, throw water from jars held in their trunks, an ornament common in images of Lakshmi. On one side of each elephant is a lotus leaf, on the other side a lotus bud and above the elephants a lotus. In the next petals on either side are standing male figures with thick armlets and large ear-ornaments and wearing the tasselled turban found on the heads of the male figures sitting on the elephants on the pillar capitals at Bedsa Each wears a *dhotar* and has his hands folded over his head. The attitude is almost as if dancing. On one side of each figure is a lotus bud and on the other side a lotus flower. In the last petal on either side women, in the same dancing attitude as the men, wear thick bracelets, large ear-ornaments, a necklace, a waistband, a waistcloth stopping at the knee, and rings on the legs.

Inscription 19.

In the half circle representing the calyx is Inscription 19. It is in one line well carved in good letters and, except the last letter, well preserved. The inscription may be read:

Yavanasa Chandanam deyadhama gabhada (*ra*) [The *ga* of *gabhada* is distinct, *bha* much resembles *ta* in shape, and the letter *da* is a little broken and spoilt. In the rough surface that follows must have been the letter *ra* but no trace of it remains. If there were no *ra* the three letters appear to read *gatija* as there seems something like a dim *ikara* over *ta*. As *gatija* gives no meaning *gabhada*(*ra*) is better.] and may be translated

The meritorious gift of an inner doorway by the Yavana Chanda. The inscription shows that the doorway of the inner hall was carved at the cost of a Yavana named Chanda.

Above the arch on the upper apex was a carving now broken. The remains suggest that it was the common Buddhist pentagonal symbol. To the right is a standing life-size Nagaraja with a fly-flap in his right hand, and his left hand resting on his hip. He wears a waistcloth, a bracelet, and an armlet. In his ears are large ear-ornaments, on his head is a tasselled turban, and round the head are five snake hoods. To the left a similar life-size figure stands like the first with a fly-flap in his right hand. His dress and ornaments are the same as those of the first. He differs from the first in having wings and as on his turban appears the head of Garuda this is apparently a figure of Garuda. The cobra king and the vulture were probably chosen to show that they have laid aside their natural hate to join in the worship of Buddha. On one side of each of the figures is a relic-shrine with a tee and an umbrella. The people call the relic-shrines *lings* as in shape they resemble Shaiv *lings*; and the figures they call *bhuts* or spirits and for that reason this group is called Bhutling or the *lings* guarded by spirits. The left face of the arch is neither dressed nor separated. The right face has been separated and to the right of the right face is a Bodhi tree, which, from the shape of its leaves, appears to be a *pipal* tree. Garlands hang from it and above the tree an umbrella is shown raised on a double plinth. A flying human figure on the left comes towards the tree but it is unfinished. On the topmost frieze below are holes for mortices but the mortices are not as usual carved from the rock but put in from without. Only two of the mortices remain. Above is the rail pattern and still higher seven arches and within each another small arch. On the sides are two similar arches one above the other. To the left of the cave, under the left end of the terrace, is an earth-filled cistern.

Cave XXXIX.

Cave XXXIX. to the right of cave XXXVIII. but on a higher level and about the same level as caves XXXVI. and XXXVII. is a cell with a broken veranda. It is 7' square and 7' high, and in the front and back walls are holes for the monk's pole. The doorway is 2' 2" broad and has holes for a wooden frame. The veranda is 7' 7". broad and its present greatest depth is 2', but much of it is ruined. To the right is a broken bench. The cave is not easily reached as the old steps are broken.

Cave XL.

Cave XL. to the right of cave XXXIX. is another cell 6' broad by 7' deep and 6' 4" high with a doorway 2' broad. The veranda and the steps to the cell are broken. Below Cave XL. is an earth-filled cistern.

Beyond Cave XL. the hill-side is not fit for excavation. After about 500 yards the north-west end of the hill is reached. Turning to the right is a narrow valley, to the right of which in a single block of rock five small excavations facing north-east have been made. Except cave XLIV. none of them seem to have been used. They have been numbered in continuation of the Bhutling group and apparently are part of the Bhutling group, as they have no separate chapel. These caves look out towards Junnar.

Cave XLI.

Cave XLI. far in the valley, is on a higher level than the other cells. It is an unfinished cell about 4' deep. About sixty-four yards to the right is an earth-filled cistern.

Cave XLII.

Cave XLII. about twenty feet below and twenty feet from cave XLI. is a veranda 7' 10" broad and 5' deep and an unfinished cell 2' 7" deep and 6' 10" high with a finished doorway 3' broad.

Cave XLIII.

About thirteen yards to the right and on the same level as cave XLII. is Cave XLIII. It is an unfinished cell 10' deep and 5' broad with, a doorway 5' 6" broad, and two holes for fixing a wooden frame.

Cave XLIV.

Below cave XLIII. is Cave XLIV. a dwelling consisting of a veranda and a cell. The veranda is 12' 5" broad 6' 10" deep and 6' high. To the right is a plain pilaster. The cell is 6' 11" broad, 6' 9" long and 6' high with a broken doorway 2' 2" broad. The floor of the inner cell is rough and unfinished.

Cave XLV.

About fifty yards to the right on a higher level is Cave XLV. an unfinished cell 6' 5" deep and 4' broad much filled with earth.

Shivner Caves.

Shivner hill has four groups of caves, two on the east or Junnar face, one on the south or fortified face, and one on the west or Nana valley face. Of the two groups on the Junnar face, one in the lower and the other in the upper scarp, the first or lower group begins below the south end of the fort. Going from right to left it has twelve caves.

Cave I.

Cave I. is a dwelling, including a cell and a veranda. The cell floor is about nine inches higher than the veranda floor. The cell is 7' 6" square and 6' 6" high with a doorway 2' 6" broad, and as high as the cell. The doorway has sockets for a wooden frame. The veranda, which is rough with an open front and broken side walls, is 16' long 6' broad and 7' 6" high. It has catch-holes and seems to have been used by cattle-keepers. Beside the veranda to the left is a large empty cistern with a mouth grooved on all four sides probably for a wooden covering. Below are broken steps. A little to the left is a plain unfinished and almost inaccessible cave. To the right appear to be two earth-filled cisterns.

Cave II.

Cave II. is a chapel including a square hall with a relic-shrine or *chaitya* and a front veranda. The hall is 19' 6" square and 10' 10" high. Ten feet from the doorway is the relic-shrine a plain plinth without a dome, and with two lines of moulding at the base and a round hole. Perhaps the dome was stone built and covered relics placed on the plinth. In the floor and walls and in the top and base of the plinth are several rice-pounding and catch-holes. A drain is cut on the left to let off water. The hall door is 5' 7" broad and 7' 9" high with thick posts for a wooden door. The veranda, which is 16' 9" long by 4' broad and 9' 10" high, has a floor 1' 5" lower than the hall floor and a roof about 2" lower than the hall roof. In front of the veranda were two pillars and pilasters, of which the right pilaster and pillar remain and the left pair are broken. They are in the usual four-plated tee and waterpot style with a central octagonal shaft. In the right corner of the back wall of the hall is a recess probably to gather water during the rains.

Cave III

Cave III. is a small dwelling cave consisting of a cell and a front. The cell, which is 9' 8" long by 8' 6" broad and 7' 8" high, has a doorway 2' 5" broad with a threshold and lintel. The door is grooved for a wooden frame. The cave has catch-holes and rice-pounding holes and is still used by cattle.

Cave IV,

Cave IV. a dwelling cave with two cells and a front, is much broken. Except the front wall of the left cell, the partition wall and the front walls of the two cells are broken. The left cell is 7' 8" long by 7' 10" broad and 7' 8" high; and the right cell is smaller, 7' 4" by 7' and 7' 6" high. The veranda is almost gone; only its left side wall and roof remain. On the left side wall an inscription in two lines records the gift of a cistern, which is probably the earth-filled recess close to the cells. The inscription is in clear letters but a part in the beginning is lost. It reads:

Inscription 20.

(1).... the Bhutenakasa

(2).... podhi cha' deyadhama and may be translated '..... of Bhutenaka, and a cistern, meritorious gift.'

Cave V.

Cave V. is about twenty feet from cave IV. on a higher level. It is a small dwelling consisting of a front and a cell 8' 5" deep 8' broad and 9' high. A smaller cell, with a doorway 2' 3" long by 3' 3" broad and 2' 8" higher than the cell floor, appears to have been begun in the left corner of the back wall of the chief cell. The main door, which is 2' 4" broad and about 8' 7" high, has grooves for a wooden frame. The left wall of the veranda, which is 10' 8" long, is broken and in a corner has a much damaged modern figure of Ganesh. The right wall of the veranda is well preserved and 6' broad. As the cave faces east it appears to have been used by Musalmans as a prayer place. The praying niche may be traced in the middle of the back wall plastered up with cowdung and white clay. To the left, on the way to the cave, is an earth-filled cistern.

Cave VI. under cave V. an unfinished and earth-filled cave, appears to have been used by cattle-keepers.

Cave VII.

Cave VII. reached by broken steps in the rock, is a cell with a small front. The cell is 7' square and 6' 7" high. The doorway is 2' 4" broad and as high as the cell. The front is small 3' 4" broad and 3' 8" long. The cave has grain-pounding holes but no catch-holes.

Cave VIII.

Cave VIII. is a large hall with a front. It seems to be neither a dwelling cave nor a place of worship. The hall is 16' 9" deep by 16' broad and 8' high, The front wall is about 1' narrower than the back wall. The doorway is 5' 3" high or about 3" less in height than the cell. It appears to have had a door with large wooden frames. The front is 14' 4" long by 7' broad. The cave has both pounding and catch-holes. About twenty steps further are two cisterns both filled and the first covered by a sweet or *kadhinim* tree.

Cave IX.

To the right of the second cistern, rock-cut steps led to Cave IX. At present the rock with the steps has fallen and the cave is hard to reach. It is a small dwelling facing east consisting of a cell and a small veranda. Though unfinished it seems to have been used as a dwelling. The cell has a greatest depth of 6' 9" a breadth of 7' 6" and a height of 6' 9". The doorway is 2' 4" wide and 6' 9" high, and had a wooden door. The veranda has irregular walls and a bench in the left wall 3' 10" broad and 3' 10" high.

Cave X.

Cave X. is a dwelling of three cells and a front. The middle cell is broken. To the left of the first cell two steps lead to a cistern below now dry and like a cell as its front is open. The first cell is 6' 10' deep in the right wall and 8' 9" in the left wall, while the back wall is 6' 7" broad. The door is 2' 5" broad. The right or partition wall with the second cell is broken. The second cell is 7' 7" long by 7' 5" broad with a doorway 2' 5" broad. This cell is ruined at the foot of the back wall and a crack appears to let in water. The third cell is 7' deep by 7' 2" broad with a doorway 2' 5" wide. The front is 16' 5" long by about 4' 9" broad and has a broken roof.

Cave XI.

Cave XI. is a cell with a small front. The cell is 7' square and 7' high with a broken doorway grooved on the left for a wooden frame. The front is broken. Six feet to the right of the cell is what looks like an earth-filled cell whose roof is on the same level with the floor of cave XI. It was probably a cistern. Further to the right, of five cisterns near one another the third and fourth hold good water. One of these two cisterns seems to have been taken care of, as it has signs of a modern door and in front has a small recess full of water for cattle or drinking water. Twelve steps lead to six other cisterns, the fifth of which holds good water, and has sockets for a wooden frame. In front of these six cisterns, a space about 10' broad, natural or artificial, has a good view of the town below, the Ganesh Lena hill to the right, Manmoda to the left, and distant hills bounding the horizon on the east.

Cave XII

Cave XII. is a cell with an open front. To the left is a bench as long as the wall, 1' 4" broad and 9" high. The cell is 9' long by 9' 9" broad and 6' high and seems to have been used as a view-seat.

The second group, in the upper scarp of the east face, has twenty-five caves going from south-south-east to north-north-west, and generally facing east-north-east. The caves have been numbered in continuation of the lower scarp caves, passing from left to right.

Cave XIII.

Cave XIII. where the scarp begins near the extreme left, is hard to reach. It is a single cell with benches in the back and right walls. It is about 7' deep 5' broad and 6' high with a doorway 2' broad and as high as the ceiling. To the left of this cell is an almost inaccessible excavation. It has an open front. It may be an unfinished cell or a cistern with a broken front. To the right of this cell a space about 70' long contained five or six cisterns of which nothing but the bottoms are left. They appear like five or six sitting places, and in later times, perhaps, were used to sit in as they have holes in front cut in the rock to support sheds. Twelve paces to the right is an open earth-filled bathing pond like what is called a *nanpodhi* in a Kanheri inscription. About twenty-five feet to the right of the pond is a cistern, and thirty-four paces further, on a higher level, is a small open-

mouthed cistern filled with earth. Eight paces further is another large earth-filled cistern and thirty-live paces further to the right is cave XIV.

Cave XIV.

Cave XIV. is about a hundred yards to the right of cave XIII. It is a two-storeyed dwelling, its ground floor in three parts, a plain veranda in front, a middle hall, and cells. The middle hall, which is 24' 5" broad 23' 5" deep and 9' high, has a large doorway 5' 9" broad and 9' high with large holes for a wooden frame. On either side is a window both 4' broad and 3' 10" high and with holes for wooden frames. Of ten cells four are in the back wall and three each in the right and left walls. Catch-holes in the walls seem to show that the cave was used for horses or cattle. The cells are on a higher level than the hall, and the ceilings of the four back wall cells are four feet higher than the hall ceiling. The three cells in the left wall are unfinished, the second more unfinished than the first, and the third still more unfinished. Of the four back cells the one in the extreme left is unfinished. The second cell is 6' 9" broad 6' deep and 6' 4" high, with a doorway 2' 5" broad and as high as the ceiling; the third is 5' 10" broad 7' deep and 6' 5" high and has a doorway 2' 6" wide and 6' 5" high with holes for a wooden frame; and the fourth 6' 2" deep 5' broad and 5' 10" high with a doorway 2' 5" wide and 5' 10" high. Of the three cells in the right wall the first two are unfinished. The third cell is 7' 10" deep by 7' 10" broad and 6' 10" high, and has a doorway 2' 5" broad and 6' 10" high with holes for a wooden frame. To the right of the third cell a passage, with a door 2' 6" broad and 9' high, leads to the upper storey. A flight of eight broken rock-cut steps leads to the upper storey, which is a plain hall 20' 8" broad 10' 7" deep and 7' high, with an open front veranda 23' 7" broad 5' 3" deep and 7' high. On its right is a quadrangular pilaster with the double crescent ornament. The original rock-cut railing seems to have been replaced by a wooden railing for which seven holes are cut in the rock. About 1' 6" of the floor near the back wall is rough and the rest is smooth, which suggests that a large wooden bench stood on the rough part. In the middle of the floor are two husking holes. To the left near the pilaster is an excavation probably the beginning of a stair leading below. In the left wall, just under the ceiling on a dressed surface and cut in large deep letters is Inscription 21 in one line. In the beginning is the usual Buddhist pentagonal symbol.

Inscription 21.

The inscription may be read:

Mudhakiyasa Malasa Golikiyasa [The second letter of this word is not distinct and looks like *mi*. But as the base of *ma* in this inscription is horizontal, and this is rounded, *li* seems preferable.] A'nadasa bena jana'na deyadhamam upatha'na and may be translated '
The meritorious gift of a reception hall by two men Mudhakiya Mala and Golikiya
A'nada.'

This shows that such halls used to be called *upathana* or *upasthana* that is a sitting place, a visiting hall, or a reception hall. An excellent view stretching to the distant hills makes this well suited for a sitting or reception hall. Mudhakiya and Golikiya, given as the

names of the donors, seem to be surnames. To the right of the passage below is a broken cistern.

Cave XV

Cave XV. about thirty feet to the right of cave XIV. is an open cell without a veranda. The walls are not finished, and the cave appears to be merely a sitting cell. In front in the floor are three holes probably for a wooden shed. The cave is 9' deep 13' broad and 6' 5" high, and in a small recess in the left wall has a roughly carved relic-shrine with three umbrellas over the tee. Outside to the right is a cistern with good water, and near it, on a higher level, another cistern filled with earth.

Cave XVI and X VII.

Cave XVI. and X VII. About forty feet from cave XV. are Caves XVI. and XVII. two dwellings with finished verandas but cells only begun. The veranda of cave XVI. is 5' 6" broad 3' deep and 7' high, and the doorway 2' 6" broad and 5' 8" high. Cave XVII. has a veranda 4' deep 19" broad and 8' high, with an unfinished floor and a finished back wall and ceiling. The half-finished cell door is 2' 5" wide and 4' 10" high. About a hundred paces to the right is what looks like an earth-filled cistern. A little further to the right are broad steps cut in the rock,

Cave XVIII.

Climbing the broad steps a second flight of twenty-seven small steps to the right, lead b to a cell-like excavation, 11' deep 12' 5"; broad and 8' 10" high, with two holes in front for a wooden frame, Four steps to the right is a cistern with good water. Holes are cut in the rock either to help the ascent or for a sun screen. The excavation has no front wall but on the back are two dry cisterns infested by bats. The cisterns, which have well cut mouths about 2 high and 3' square, are about 13' deep and have holes over the mouths for a wooden frame. Between the two mouths is a small polished bench 8" broad 9" high and 3' 9" long. These cisterns are dry and probably were granaries.

Cave XIX.

About twenty feet further to the right is Cave XIX. a cell 8' 10" broad 7' 3" deep and 6' 3" high, with, along the right wall, a polished bench as long as the wall 1' 4" broad and 1' high. At the end of the bench, in the right and back walls, a small recess, 1' 6" square and 4' deep with a small bench, was probably used for keeping objects of worship. Between this cave and cave XVIII. steps led to the top of the fort and to the left a beginning of steps remains. These steps must be older than the Musalmans as they have recesses with images of the guardians Durga, Ganesh, and Batuka. [The images of Durga and Ganesh, which were cut in the rock, still appear; the image of Batuka is gone as it was probably not rock-cut.] The steps and images have been broken probably by the Musalmans, and a small fortification has been built on the top to close this way of approach. This confirms

the belief that before the Musalmans (1320), under the Devgiri Yadavs (1150-1310), the hill was probably used as a fort.

Cave XX.

Cave XX. about ten feet to the right of cave XIX. is an open cell about 7' broad 5' deep and 7' high, with an earth-filled cistern at the foot of the right wall.

Cave XXI.

Cave XXI. ten paces to the right of cave XX. is a large hall 19' 8" broad by 22' 6" deep and 8' 10" high, with a finely polished floor ceiling and walls. Along the back right and left walls are benches 1' 7" broad and 1' 8" high. In the middle of the back bench an altar 5' 6" broad stands 3' 5" in front of the bench and as long as the sides. The hall front is open with no doorway, but on either side is a pilaster and in front a small open veranda, 16' 8" broad and 2' 5" deep. The veranda ceiling is 1' lower than the hall ceiling. Like other similar halls this appears to be a dining hall or *sattra*. The only point of note is the advancing altar in the middle, which apparently was for the chief monk.

Cave XXII.

Inscription 22.

Cave XXII. is a large dwelling, consisting of a hall, with in the right wall two and in the back wall four cells. The hall was originally 24' 6" deep of which 7' in front are on a one-inch lower level to make it a veranda, the remaining 17' 6" being the hall with the cells. The veranda part has benches on either side, the left bench broken. The cells are about a foot higher than the hall and the ceilings are 3" to 5" lower than the hall ceiling. The cells vary from 6' 6" to 7' square and are about 6' 6" high. The last cell in the back wall is unusually large, being 10" broad and 13' deep. Near the end on the right wall, this cell has a bench 3' 1" broad 6' 4" long and 2' 6" high, and near the bench in the front wall is a niche. This cell was probably for the chief monk. The other cells have peg-holes and no benches. In the veranda over the right bench was an inscription in two lines of well cut deep letters. It has been intentionally scraped away and only a part of the beginning and end of the first line appear. In the beginning is the Buddhist trident. The first letter *yo* is distinct and then appear traces of the letters *nakasa* which show that the cave was probably the gift of a *Yavana*. At the end of the second line the letters *achariya* are distinct, and then appears the top-stroke of *na* the piece of rock below having broken away.

Perhaps there was a wooden screen or wainscoting between the veranda and the hall as holes are cut in the ceiling just at the point which marks the boundary line. In the scarp which overhangs the cave about fifteen holes are cut probably to support a wooden roof. In later times a wall of well dressed stones has been built between the veranda and the hall in the place of the old wainscoting and an ornamental doorway has been built near the left end. Near the east end in a recess 2' 2" broad and 1' 9" long is a well carved

lattice. The shape and ornamentation of the doorway belong to about the ninth or tenth century. On the doorway in the middle of the lintel is a broken image of Ganesh which shows that the additions were Brahmanical. But no trace remains of any object of worship inside. To the left of the veranda is a large cistern, part of which runs under the veranda floor. But as the floor and part of the overhanging rock have fallen away, it is open to the sky. To the left of the cistern is a dwelling whose right and front walls are broken. It is 15' 2" broad 11' 6" deep and 8' 3" high, with, along the entire left wall and half the back wall, a rock-cut bench 1' 9" broad and 1' 1" high, and along half the right wall a seat about 2" high. In front of the broken front wall is a broken cistern. A break in its right wall has joined it with the large cistern of the cave. To the right of Cave XXII. are two broken-fronted cells one above the other which were probably connected with Cave XXII. The upper cell is 15' square and 6' 8" high. The front part of its right wall is broken. Near the other end of the right wall a part of the floor has been broken. Of the lower cell, which is smaller than the upper cell, both the sides and part of the ceiling which forms the floor of the upper cell are broken. Its walls are well; polished. To the right a polished doorway now broken led to cave XXIII. which is on the same level as the lower cell.

Cave XXIII

Cave XXIII. is an open veranda and an inner hall. The veranda roof has fallen out and lies in the veranda. The inner hall is 20' 8" broad 13' 9" deep and 8' 4" high. It has a plain polished doorway 2' 7" broad and 5' high and benches of varying size along all the walls. The bench along the entire length of the back wall is 1' 5" broad and 1' 2" high and connected with it is a bench 1' 7" broad 4' 10" long and 2' 8" high in the corner between the left and the back wall. The bench along the right wall is 7' 4" long and equal in height and breadth to the bench along the back wall. Connected with this bench, in the corner between the right and front walls, is a large bench 3' 7" broad 6' 5" long and 2' 2" high. The open veranda, which is much broken, is 18' 8" long and about 10' broad. In the left wall a broken doorway communicates with the lower cell next to cave XXII. To the right of the doorway is a small niche and to the right of the niche is a galloping horse with a saddle and reins but without stirrups. [The horse appears to have been carved as a fancy work by some artist while polishing the wall.] It is hard to understand to what use this cave was put. It has no separate cells for monks, nor is it a dwelling for a single monk. As it has benches of varying size it was probably used by various monks of different ranks, perhaps as a place of learning, the high bench on the right being for the preceptor the *Acharya* or *Sthavira*, one in the left corner a little lower being for the sub-preceptor or *Upadhyaya*, and the rest for scholars. To the right of the cave is an unfinished recess.

About a hundred yards to the right, a group of fourteen caves near one another are popularly called the Bara Gadad or Twelve Caves from the twelve cells in cave XXX. which is in the middle of the group.

Cave XXIV.

Cave XXIV. the first, of this group is on a higher level than the rest, and is reached by about forty broken rock-cut steps. It is a large dwelling left unfinished apparently not on account of any flaw in the rock. The veranda, which is 7' 9" deep by 33' broad and 7' 5" high is finished, though much of its floor is broken. In the veranda to the left is a cell 5' 5" broad 4' 4" deep and 6' 3" high with a door 2' 8" broad and a small bench 2' 10" long 2' 2" high and 1' broad. The hall, which is only partly cut, is 6' 4" deep 18' 3" broad and 7' 5" high. To the left is a window. Though unfinished the cave seems to have been used, as the doorway seems to have had a wooden door for which holes are cut in the rock. To the left, near the first cell, is another unfinished cell in the back wall of the veranda, 6' 10" broad 7' 7" deep and 7' 1" high with a door 3' 2" broad and 7' 1" high. Perhaps the cell was the beginning of a cutting to join it with the hall, its door, as in other caves, serving as a side-door.

Cave XXV.

About thirty feet to the right of cave XXIV. and on a rather lower level is Cave XXV. a large cell 13' 6" broad by 13' deep and 9' 7" high. It has an open front and a large broken cistern to the left.

Cave XXVI

Close to its right is Cave XXVI. a small cell with a broken front. To the left is a broken bench 2' 5" broad and 2' 5" high. The cell, which is 9' 4" broad 7' 7" deep and 6' 9" high, was painted apparently in circles. Close to its right is a small recess with a bench, apparently a small view-seat.

Cave XXVII.

Cave XXVII. is a dwelling in two parts an inner cell and a veranda. The cell is 7' 6" broad 7' 2" deep and 6' 8" high and, to the left in a recess, has a bench 2' 7" high by 2' 3" broad and 6' 4" long. The door, which is about 2' 6" broad and 6' 8" high, has holes for a wooden frame, and the veranda is 13' 6" broad and about 5' 11" deep. In a recess in the left wall, which is 4' 11" deep, is a relic-shrine in half relief consisting of a round dome with a tee and umbrella. The plinth with the rail pattern is broken. Beyond the left wall is a cistern with a broken top. The veranda ceiling is 9" higher than the hall ceiling. In the veranda to the left of the doorway is Inscription 23 in five large lines in letters like those of the Vashish-thiputra inscription in Nasik cave III. [Compare Bombay Gazetteer, XVI. 549-554.] except that the *ikaras* of this inscription are rounded and winding. The first two lines are entire. Nearly the first half of the third line appears to have been intentionally rubbed away about the time of the inscription, and the surface where the letters are rubbed away is slightly lower. Traces of some of the letters appear but the letters cannot be clearly made out. The inscription may be read:

Inscription 23.

Apaguriya'na savagiriya'sa (sa) putasa patibandhakasa giribhutisa sakhuyarusalena podhi cha

(2). (de)yadhamam [The *de* of *deyadhamam* has been omitted by the engraver by mistake.] etasa oha lenasa podhiya cha nakare cha bhikhuni upasayasadham mutari ya'na akhayanivika

(3).eto lenasa chivarika kaha'pana [The *na* of *Kahapana* looks like *ko* through a mistaken stroke of the engraver below.] sodasa podhiya chiva

(4).esa [*Esa* looks like *epa*. The curved stroke at the side has been omitted or perhaps rubbed away when smoothing.] manam cha bisa hasato payoga'to riva dhisahasam vadham [The three letters after *vadham* are not well engraved.] upayyasa

(5).ya upasayo nagare giribhutisa bitiyika'yi Sivapalanika'ya and may be translated 'The meritorious gift of a dwelling cave and cistern by Patibha dhaka Giribhuti son of a Savagiriya of the Apaguriyas, with his wife S'ivapa'lanika'; for this a permanent capital In front of the veranda of this cave holes are cut in the rock probably for a wooden shed.

Cave XXVIII.

Close to the right of cave XXVII. are Caves XXVIII. and XXIX. At first sight these two appear to be one dwelling but examination shows them to be two. The veranda ceilings of the two are separate, and Cave XXVIII. juts out a little more than cave XXIX. Between the two was originally a wall, and, when the wall was broken, a wooden partition appears to have been made for which these holes are made in the ceiling. Both are dwelling caves and consist of a veranda in front and two cells each in the back wall. The first cell, which is 10' broad 9' 5" deep and 7' 5" high, has a window 2' 1" broad and 2' 4" high in the front wall, to the left of the door which is 2' 3" wide and 6' 5" high. The window and the door have holes for a wooden frame. The second cell is 9' 1" broad 8' 3" deep and 8' high and has a door 3' 2" broad and 8' 8" high, with holes for a large wooden frame. To the left, in the front and back walls, are holes probably for the monk's pole. The floors of both the cells are 4" lower than the veranda floor and the ceiling is as high as the veranda ceiling. Remains in the ceiling, especially in the second cell, show that both the cells were painted. The painting was of a poor order consisting of three concentric circles in square panels. The colours used were white, yellow, and black. The veranda is 22' 3" broad 5' 3" deep and 7' 8" high. Nearly half of the floor in front is broken. The roof is entire and about an inch higher than the veranda roof of cave XXIX.

Cave XXIX.

Cave XXIX. close to the right of cave XXVIII. consists like cave XXVIII. of two cells, with a front veranda whose forepart as in cave XXVIII. is broken. The first cell is 10' 2" broad 8' 9" deep and 7' 1" high, with a doorway 3' broad and 7' 1" high. The ceiling is 2" lower than the veranda ceiling. The second cell is 8' 11" broad 9' deep and 8' 1" high and

has a door 2' 8" broad with holes for a wooden front. To the left, in a recess 2' 10" deep 7' 1" broad and 2' 9" high is a bench, and to the left in the front and back walls are holes for the monk's pole. Both cells have husking holes. Both were originally coated with plaster and painted and traces of the plaster remain. The veranda is 23' 10" broad and 5' 3" deep, and has a broken right wall. Further to the right are three cisterns, the middle cistern holding good water.

Cave XXX.

Cave XXX. is a large dwelling with twelve cells or *barasagabbham*, four cells in each wall. The cave, which gives the group its local name of Bara Gadad, consists of a veranda, a middle hall, and four cells each in the right back and left walls. Near the cell doors, all along the walls, runs a bench about 2' broad and 1' 1" high. The hall is entered by a large middle doorway 6' broad and 8' 9" high, and a left doorway 3' broad and 6' 10" high. On either side of the large doorway is a large window, the left window 6' 10" broad and 3' 10" high and the right window 6' 8" broad and 4' high. Both the doors and windows have holes for wooden frames. The hall is 33' 5" deep 38' broad and 10' high. The ceiling has remains of plaster with traces of colour. Except the third cell on the left the cells are finished and stand from 6" to 1' higher than the bench all round in front of them. The side walls of some are not finished and are unequal in size. The cells vary in depth from 5' 7" to 7' 7" and in breadth from 5' 2" to 8'. The doorways are about 2' 5" broad and almost as high as the cell ceiling. The veranda, which is partly ruined, is 34' 3" broad 5' 6" deep and 8' 9" high.

Cave XXXI.

A flight of thirteen broken rock-cut steps from the left of the veranda of cave XXX. leads up to the veranda of Cave XXXI. This cave is almost a part of cave XXX. as it is connected with its veranda. It is a dwelling consisting of a veranda and an inner hall. The hall is 15' 9" broad 14' 8" deep and 7' 6" high, and has a door 3' 5" wide by 6' 10" high with holes for a wooden frame. The veranda is 18' 7" broad 4' 4" deep and 8' 2" high, its floor about 2' lower than the hall floor. In front of the veranda were two pillars and two pilasters. The pillars are broken and only their six plated capitals remain attached to the ceiling. The pillars appear to be undressed and their shafts and bases were never begun. The pilasters, which are nearly quadrangular, are undressed and unfinished.

Cave XXXII.

Cave XXXII. close to the right of cave XXX. and on a higher level, is a small dwelling consisting of a veranda and an inner cell. The cell is 7' 8" broad 7' 6" deep and 7' 6" high and has a doorway 2' 10" broad and 7' 6" high with grooves for a wooden frame. The veranda, whose floor is partly broken, is 16' broad 4' 3" deep and 7' 6" high. In a recess to the right is a small seat 2' 6" high 3' 9" broad and 2' 4" deep. The cave was painted and the ceilings of both the cell and the veranda have remains of plaster and colour.

Cave XXXIII.

Cave XXXIII. is close to the right of cave XXXII. with two cisterns between them. It consists of a veranda, a cell, and a half cell. The veranda is 8' 2" broad 6' 9" deep and 9' 4" high. In the back wall of the veranda is the half cell 3' broad 5' 8" deep and 6' 10" high with the ceiling 6" lower than the veranda ceiling, and a wooden door whose grooves remain. To the left of the half cell is a seat recess 4' broad 2' 3" deep and 4' high. To the left of the veranda is the cell, with a greatest depth of 7' 6" a greatest breadth of 9' 2" and a height of 6' 5", and a broken door 2' 9" broad. Its back and front sides form an angle and the back and left sides form an arc of a circle, a peculiarity of shape due to two cisterns below, whose tops are now broken.

Cave XXXIV.

Cave XXXIV. close to the right of cave XXXIII. is unfinished.

Cave XXXV.

Cave XXXV. close to the right of cave XXXIV. is a *panchgarbha layana* or five-celled dwelling. It consists of a hall and five cells, three in the left wall and two in the back wall. The hall is 18' 7" broad 18' deep and 7' 3" high with a doorway 5' 10" wide, and 7' 2" high. To the right of the doorway is a broken window 4' 10" broad and 2' 2" high. Both the door and window have grooves for a wooden frame. In the back wall, in a recess between the cells, is a relic-shrine or *daghoba* in half relief. The plinth of the relic-shrine is 1' 3" high and 3' 5" in diameter, and the dome is 3' high with a diameter of 3' above the middle and 2' 6" at the base. Over the dome is the rail pattern 5" high and 10" broad and the tee 8" high in four plates, and on the top of the fourth plate, which is 1' 7" broad, is a beaded carving. Over the plates is the shaft and over the shaft an umbrella 3" high. The cells, two in the back wall and three in the left, vary from 3' 8" to 7' in breadth and 4' 8" to 6' 7" in depth and are all about 7' high. The cell doors are 2' 4" wide and 7' high. All the cell doors, as well as the large door and window of the cave, have grooves for wooden frames.

Cave XXXVI.

Close to cave XXXV. is Cave XXXVI. the great chapel cave of the group. Though both are in the same veranda, cave XXXV. is a little older than its neighbour. When the chapel was cut, its veranda seems to have been joined with the veranda of cave XXXV. The veranda ceiling of cave XXXV. was originally lower than now, being joined with the veranda ceiling of the chapel. The marks of its original height and breadth can still be seen in the wall.

Cave XXXVI. is the chapel or place of worship of this group. It is in two parts, a hall with the relic-shrine and a large veranda in front of both this and cave XXXV. The entrance to the hall is by two doors a main door in the middle 6' 3" broad and 11' 3" high and a side door to the left 4' 8" broad by 7' high originally a window but afterwards a doorway. To the right of the middle door is a window 3' 5" broad and 5' 11" high. The doorway leads into a space 4' 8" broad beyond which is a raised plinth five inches high

and three feet broad on which are pillars and pilasters. Over the, pillar capitals is a quadrangular shaft on which the roof rests. The shrine, containing the relic-shrine or *chaitya*, is 31' deep by 21' broad' and is two inches higher than the outer space. In shape the *daghoba* or relic-shrine is of the Gotamiputra period (A.D. 35-1507), its plinths 32' 3" in circumference and 4' 9" high. Over the plinth is a 1' broad belt of rail pattern. Over the belt of rail is a flat dome 5' 3" high and over the dome the capital with rail pattern. Over the capital is a four-plated tee in all 3' 4" high. Over the tee is a shaft and an umbrella cut out of the ceiling. The ceiling has remains of painting consisting of concentric circles in square panels and flowers and leaves in the vacant corners. The panels are in five plates, a black plate in the middle and two white and red plates on either side. Some panels have seven plates a black plate in the middle with three plates white, red, and yellow on each side. The circles are mostly the same in colour, the innermost yellow, the next red, the next a large white circle, the next a smaller red circle and the last a large white circle. Some have an outermost red circle with scroll patterns. Four steps lead to the veranda which is 47' broad and 11' 10" deep. On the back of the veranda by the side of the doorway and along the right wall are benches 2' broad and 1' 3" high. The veranda ceiling is lower than the hall ceiling. In the back wall, of the veranda to the right of the right window is a beautiful inscription well cut and well preserved with a fine altar-like symbol in the beginning. The inscription may be read:

Inscription 24.

- (1) Virasenakasa gahapatipamughasa
- (2) dhammanigamasa deyadhammam chetiyagharo
- (3) niyuto savalokahitasukha'ya

and may be translated

' The meritorious gift of a chapel cave of Virasenaka a chief householder, an upright merchant, assigned for the welfare and happiness of all.' In the veranda to the right is a cistern. Then follow three other cisterns two of them earth-filled. Then comes the beginning of an excavation and after this a cistern with broken front and looking like a cell. Next comes another excavation a cistern with a broken front. Its mouth appears and in the recess was an inscription in large letters of which traces remain. In one line the letters *sa gatana* can be read. After the cistern on the same level is another cistern with a broken front. A part of its mouth and recess appear above and in the recess is Inscription 25 which reads:

Inscription 25.

Yavanasa Irilasa gata'na deyadhama podhiyo

and may be translated ' The meritorious gift of two cisterns by the Yavana Irila a Gata'na P' The two cisterns mentioned in the inscription are this and one to the left.

Cave XXXVII.

Close to the last cistern is Cave XXXVII. a cell with a broken veranda floor. The cell is 7' 8" broad 7' 8" deep and 6' 3" high, and has a door 2' 6" broad and 6' 3" high with grooves for a wooden frame. The veranda is 6' 4" broad and 4' 2" deep To its right is a broken cistern in whose recess is Inscription 26. in two lines. The middle of the inscription is water-worn. It may be read:

Inscription 26.

(1) Apaguriya'na Savagiriya'sa putasa patibadhakasa (Gi)ribhutisa sa (ha)bhaya'ya
Sivapa'linaka'ya

(2)(de)yadhama podhi lena cha etasa akhayanivi pa'si.....chara'.....

(3) ha'pana' evo

and may be translated

A cave and a cistern, the meritorious gift of Patibadhaka Giribhuti. son of Savagiriya'sa of the Apaguriyas, with his wife Sivapa lanika for this a permanent endowment.....'

The third or west face group of six caves is in a curve in the upper scarp. The caves generally face west and are numbered from right to left in continuation of the upper scarp of the east face.

Cave XXX VIII

Cave XXXVIII. is the first in the curve beginning from the right. Further to the right are what appear to be cisterns now out of reach. Cave XXXVIII is a large cell, 17' 4" deep 15' 4" broad and 7' 6" high. Its front wall is broken and holes have been cut for a wooden screen dividing the cave into a veranda and a cell. The holes of the screen still appear in the ceiling. To the right of this cell is a cistern. The ceiling has old plaster and appears to have been painted. The coating and plaster on the walls are modern. The cave has some modern stone and clay work and husking holes.

Cave XXXIX.

Cave XXXIX. twenty feet to the left of cave XXXVIII. is a cell 9' 7" broad 8' deep and 6' high with a broken front.

Cave XL.

Twenty feet further to the left is Cave XL. a cell 8' deep 10' 2" broad and 6' 6" high with the left and front walls broken. Along the left wall is a broken bench. To the right is an excavation which was abandoned on account of a crack in the back wall.

Cave XLI.

About twenty-five feet to the left, on a slightly higher level, is Cave XLI. a dwelling with four cells or *chaugabbha*. The cave is in three parts a veranda, a middle hall, and four cells, two in the back wall and one in each side wall. The hall, which is 15' 6" broad 14' 4" deep and 8' high, is entered by a middle door 4' 2" broad and 7' 2" high with a window on either side, the left window 4' 4" high and 2' 6" broad and the right window 4' 6" high and 2' 8" broad. All three, the door and the windows, have grooves for wooden frames. The cell floor is about 1' higher than the hall floor and the ceiling is 3" to 8" lower than the hall ceiling. The left cell is 6' deep 6' broad and 6' 2" high with a doorway 6' wide and 6' 2" high. The cell has no bench. The left cell in the back wall is 7' 2" deep 6' 3" broad and 6' 6" high with a door 2' 5" wide. Along the left side is a bench 2' 3" broad and 2' 5" high. The right cell in the back wall is 7' 2" deep 6' 2" wide and 6' 2" high with a door 2' 2" wide and 6' 2" high. Along the right side is a bench 2' 5" broad and 2' 2" high. The right cell is 7' 3" deep 6' 4" broad and 6' 3" high with a door 2' 5" wide and 6' 3" high. Along the left wall is a bench 2' 2" broad and 2' 2" high. All the cell doors have grooves for wooden frames. Except the left wall cell all have hole in the side walls for the monk's pole. The veranda is 6' deep and 19' 4" wide. Its floor is broken, but the ceiling is in good order and on a level with the hall ceiling. To the left are five cisterns.

Cave XLII.

About seventy yards to the left of the five cisterns comes Cave XLII. In the middle are several cisterns mostly filled up and hidden from view. Cave XLII. is a small cell 7' 2" deep 7' broad and 7' high with an open front or veranda. The front wall of the cell is broken. It had a doorway with grooves of which marks remain in the floor and ceiling. The veranda side walls and floor are broken, and the ceiling has remains of plaster and painting.

Cave XLIII

About thirty feet to the left of cave XLII. is Cave XLIII. a large hall with a veranda. The veranda is 32' broad and 3' 6" deep with on either side a quadrangular pilaster. Between the pilasters were four pillars on which the ceiling beam rested. The plated capitals of the pillars hang from the beam. The pillars do not seem to have been broken from below the capitals, as the surface of the last plate of each capital is dressed and smoothed and has a central hole about 1½' square. The hole would seem to show that some mistake was made in cutting out the pillars and that wooden pillars were fitted into the holes. The roof projects four or five feet beyond the veranda beam. A door in the back wall of the veranda, with a window on each side, leads into the hall. The door is 5' broad and 7' 11" high, the left window 3' 9" broad and 2' 11" high, and the right window 4' broad and 2' 11" high. The hall is 27' 5" deep 30' 7" broad and 8' 6" high. All along the walls runs a

bench 1' high and 1' 6" broad. The veranda and hall ceilings, especially the hall ceiling, have remains of painting. In the hall the painting is very clear and consists of concentric circles in square panels, a style common in these caves, but here with the unusual addition of patterns in the circles. Of the colours green is the best preserved. Outside the veranda on either side are a series of rock-cut holes to fit wooden pillars. As the cave faces west, temporary *mandaps* or awnings were probably built on either side for the monks to rest of an evening. To the right of the cave is a cistern holding good water and to the left also must have been cisterns though they are entirely ruined.

South Group.

The fourth or south face group of seven caves is in the lower part of the upper scarp. The way to the caves turns to the right after passing the fifth gate or Shivabai Darvaja and leaving the main road to the fort. The way passes by some large modern rock-cut cisterns, and leads to the temple of Shivabai where the caves begin. The row of caves runs from west to east and generally faces south. The caves are numbered from left to right in continuation of the third or west face group.

Cave XLIV.

Cave XLIV. is a large hall 20' 3" deep 21' broad and 9' 1" high, with a broken front. The Marathas have turned the cave into a temple 32' long and 25' 8" broad in outside measurement. In front of the temple is a raised veranda 60' long 37' broad and 20' high with two side buttresses jutting out. It is built of fine dressed stones and over it the temple hall or *sabhamandap* is built turning the cave into a shrine. The *mandap*, 26' 6" long 21' broad and 11' high, is built in the dwelling style. The roof rests on two rows of wooden pillars carved in the Moghal cypress-tree style, and in the floor between the two rows of pillars is a hole for a fountain. Between each pair of pillars is a well carved wooden arch in the Moghal style and over the arches between two beams is a strip of wood with well carved patterns. The side walls of the hall are built of dressed stones and the front wall of brick and the roof is flat and tiled. A broken part of the shrine front has been repaired with fine dressed stones and over it is a wooden latticed screen of good workmanship with two small pillars of the same style as the hall pillars. In the back wall of the shrine, on a stone altar in a wooden porch, is the goddess Shivabai a shapeless piece of rock covered with redlead. The goddess is said to be the family deity of Shivaji, who was born in this fort. In the beam over the doorway are somewhat damaged paintings. The paintings are good specimens of Maratha art with figures of Brahma and his daughter Sarasvati, Shiv, Vishnu, the moon, the planet Rahu, and other gods. The middle painting, which is spoilt, appears to have had figures of Shiv and Parvati. Inside the shrine, on the side and back walls, are well executed and well preserved paintings. As specimens of Maratha painting of the 17th century they are worthy of note. The side walls have three panels, each about 7' long and 4' broad. The left wall gives scenes from the Ramayan. The first panel paints the fight between Ram and Ravan. With Ram is a large force of monkeys; with Ravan an army of fearful demons. Each leader sits in a large chariot. Among weapons of war are spears, arrows, and large stones. In the second panel is the fort of Janakpur and outside the fort a king going in procession or *svari*. Above is

Janakpur where Ravan Ram and other kings have come to be present at Sita's consort-choosing or *svayamvar*, and where, from a balcony, Sita invests Ram with the wedding garland. Above, two processions approach from opposite sides. In the third panel Ram is sitting with Sita. Facing Ram are Vashishth and other seers, and behind Ram stand Lakshman, Bharat, and Shatrughna, and Hanuman comes with monkeys and bears and falls at the feet of Ram, while one monkey presents Ram with mangoes. Above in the same panel sits Vashishth approached by Ram and his three brothers with Sita and Hanuman in front. Behind Vashishth are several sitting women.

On the right wall are scenes from the life of Krishna in four panels, the first panel small, the other panels as large as the left wall panels. Beginning from the left, in the first panel is Indra falling at the feet of Krishna, giving him a cow, and asking; pardon for his fault in harassing Krishna with too much rain. Above, the gods play music and drums and heavenly damsels or *apsaras* strew flowers over Krishna. In the next two panels are the child-like pranks or *bala lila* of Krishna who steals butter from cowherdresses, goes with his friends and breaks their curd pots, sits with his favourite Radha and other women in swings, and takes, presents from women. Some of the paintings are of every-day life, cowherds husking grain, cooking, grinding corn, and minding the dairy. Above, Krishna upholds the mountain Govardhan and saves cowherds and cows. From the heavens clouds in the form of elephants, from their trunks deluge the mountain with water. In the third panel Krishna carries off Rukmini in his chariot from a temple. Then follows a fight between Krishna and Shishupal the brother of Rukmini. Above in the same panel is Krishna with Rukmini, and higher still are gods. In the fourth panel is the scene of Draupadi's consort-choosing, and Arjun shooting a fish with an arrow aiming from a reflection of the fish in a waterpot below. Then follows Draupadi investing Arjun with a wedding garland. Above, a scene represents the churning of the ocean with the gods at one end of the serpent-rope and the demons at the other end.

In the back wall are six panels. In the first panel, beginning from the left, is the figure of a goddess with ten heads ten hands and ten legs. In the second panel is the Mahishasurmardini or buffalo-demon-slaying goddess. In the third panel is the same goddess again with one head and twenty hands. Above, in a long panel, are the first five incarnations of Vishnu as the fish, the tortoise, the boar, the man-lion, and the dwarf. In the first panel to the right of the image of Shivabai is Narayan lying on his serpent couch; in the second panel Shiv and Parvati; and in the third panel Shiv in the Trimurti or trinity with Brahma and Vishnu. Above, in a long panel, are the six incarnations of Vishnu, Parshuram, Ram, Krishna, Buddha, Kalki, and Vatashayin. The image of Buddha is like the image of Vithoba at Pandharpur.

In the back wall of the shrine is a stone umbrella on an altar of well dressed stones. Under the umbrella on a small stand of well-dressed stones is a rude stone covered with redlead the image of Shivabai. A little to the right of the temple and on the same level is a dry cistern.

Cave XLV.

Cave XLV. to the right of Shivabais temple and on a lower level, is a small dwelling consisting of a cell and a veranda. The front pilasters of the veranda are broken. The cell is 7' long 7' broad and 7' high with a doorway 2' broad, half built up from below probably by the Marathas or Musalmans, who seem to have used the cell as a store-room. The veranda is 10' 4" broad by 5' 4" deep and 7' 6" high. Close to the right of the cave is an unfinished excavation, the beginning of a cell.

Cave XLVI,

Further to the right is Cave XLVI. a dwelling consisting of a cell and an open veranda. Within the cell is a half cell in the back wall with a benched recess to the left. The cell is 7' 8" deep 10' broad and 7' high. The half cell is 3' 5" broad and 6' deep, and the bench 2' 3" broad and 5' 11" long. The right of the front wall is broken, but the width of the cell door 2' 3" can be traced from marks in the ceiling. The door has grooves for a wooden frame. The veranda, whose floor is broken, is 24' broad 4' 10" deep and 7' 5" high. In the back wall of the veranda, to the left of the door, on a smoothed surface, is Inscription 27 in two lines well cut and well preserved. It may be read:

Inscription 27.

(1) Ugaha [On *ga* of *Ugaha* appears something like a stroke. The word may be *Ugaha*.]
upa'sakasa putasa

(2) Isipa'litasa [The *ikara* of *si* in *Isi* is very dim.] saputakasa [The base of *pu*, the vertical stroke for the *ukara*, is faint.] danam

and may be translated

The gift of Isipa'lita son of Ugaha an Upa'saka with (his) sons.

Cave XLVII.

Cave XLVII thirty feet to the right of cave XLVI. and on a rather higher level, is a dwelling consisting of a veranda, a cell in the right wall of the veranda, a cell and a half cell in the back wall, and a seat recess in the left wall of the veranda. The back cell is 7' deep 8' broad and 7' high with along its back wall, in a recess, a bench 2' broad and 2' 4" high. The cell door is 2' 7" wide and has a small window to its right. The half cell to its left is 5' deep 3' broad and 7' high. The cell to the right of the veranda has lost its front and right walls. Along its left runs a bench. The recess in the left wall is 2' 1" broad and 2' 5" high. Its left part is broken. The veranda, which is 14' 5" broad 8' 4" deep and 7' 5" high, has part of its floor and ceiling fronts broken.

Cave XL VIII.

Cave XLVIII. about twenty-five feet to the right of cave XLVII. is a hall 15' broad 18' deep and 8' high. On the back right and left walls is a bench about 1' high and 1' broad.

The bench is not well finished and part of it is broken. It has an open front with two pillars somewhat like pilasters. On the face of the left wall is a well cut inscription in four lines. In the beginning of the first line is the Buddhist trident and at the end of it is the *svastika* mark. The inscription was hidden by a modern wall. It may be read;

Inscription 28.

- (1) Yavanasa
- (2) Chitasa gatanam
- (3) bhojanamatapo
- (4) deyadhama saghe

and may be translated '

The meritorious gift of a refectory by the Yavana Chita Gatanam for the Congregation. To the left of this hall is a cistern and beyond the cistern a bench in a small recess. To the right of the hall is another cistern.

Cave XLIX.

Close to the right of the right cistern is Cave XLIX. a small dwelling consisting of an open veranda and an inner cell. The cell is of very little depth and the left side is not fully cut because of a layer of soft clay in the rock. The cell is 4' 5" deep 10' broad, and 7' high. The doorway is 3' 3" wide and 7' high. The veranda, whose floor and ceiling are partly broken, is 8' 7" broad and 10' high. To the right of Cave XLIX. are three cisterns.

Cave L.

Cave L. close to the right, is a large quadrangular chapel or *chaitya* with a flat roof. It is in three parts, a shrine, a veranda, and a large hall to the right. The shrine is 11' broad and 20' 8" deep and the relic-shrine or *chaitya* is 12' from the doorway. It consists of a round plinth over three circular bands with, over the plinth, place of the usual rail pattern, another round band about four inches narrower in diameter than the plinth. Over the band is flattish round dome without a tee. To the right of the chapel a doorway leads into a large hall which has a main doorway in the veranda. The hall is 22' 4" deep 24' broad and 8' 4" high. Along its back wall is a recess about 8' high, and in the recess, along the entire back wall, is a bench 3' broad and 3' high. In the middle of the bench are two holes on a square dressed surface probably intended for setting an image. The work may be old or modern. The bench is higher than the benches in caves and looks modern. In front of the chapel is the veranda 23' broad 4' deep and 10' high. It had two front pillars and two pilasters and traces of the right pillar and right pilaster remain. The chapel doorway is 5' 3" broad and 10' high. It has grooves for a large wooden frame. This doorway and half of the right side door, leading from the chapel into the hall, have been closed by a modern

work of stone and cement. It appears that either under the Musalmans or the Marathas the chapel was used as a granary or storehouse or as an ammunition room. It is now dark and full of bats. To the left of the doorway just under the ceiling is Inscription 29 in one line of well cut letters. The inscription may be read: and may be translated

Inscription 29.

Uga'haputasa Isipa'litasa sapariva'rasa chetiyagharo da'nam. and may be translated

' The gift of a chapel cave by Isipa'lita (sk. Risipalita) son of Uga'ha with (his) family.'

Further to the right a modern fortification prevents further passage-Beyond the fortification are three excavations, too hard to get at but seen from below in climbing the fort.

Tulja Caves.

The Tulja group of eleven caves is in a hollow in the east face of the Tuljabai hill [The hill takes its name from a modern figure of the goddess Tulja cut in Cave III.] about two and a half miles west of Junnar and a mile and a half west of Shivner. The hill, which is about 400 feet high, has, about 100 feet above the plain, a scarp half hidden by earth and stone washed from the upper slopes. A gap or curve divides the hill into two blocks or spurs, and the row of caves are cut in a short scarp of rock, on the east face of the south or right block, at the head of a valley about 100 feet above the plain. From Junnar the way to the Tulja caves passes under the great pointed northern scarp of Shivner, which from below looks like the black hull and rounded stern of some huge ship. To the left is the west face of Shivner with a sprinkling of brushwood in the lower slopes, and, above, a great unbroken wall of trap curving south-east, and then with a sharp bend turning south-west. In the curve is the third Shivner group of six caves. At the south-west end the cliff is lower and an outwork on the face of the hill-side marks the only approach to the hill top. Except a rough rocky stream to the east of Shivner, the road is level and easy for a cart. On the right bank of the Kala or Jauna stream, half a mile beyond Shivner, is a small square temple of the Jam goddess Padmavati the guardian of Parasnath the twenty-third Tirthankar, with square stone walls and a brick dome. One or two old stones lie close to the north of the temple.

The way to the caves climbs the Tulja hill by an easy path up the left or south side of the valley. The front of the first four caves is dressed with a modern masonry wall, and about the centre of the line of caves, about twenty feet below, is a modern water cistern with a masonry wall on the east and south. The verandas and fronts of most of the caves have fallen leaving, towards the right, one or two patches carved in horse-shoe arches and belts cut in the Buddhist rail pattern. The caves have a pleasant outlook to the east. The great scarp of Shivner lies on the right, and about four miles further the bare slopes and wall-like cliffs of the Hatkeshvar or Suleman hills. Between the two lie the broad plain and the trees and garden lands of Junnar.

The caves are near one another in one row from left to right, facing on an average east-north-east.

Cave I.

Cave I. is a *panchgarbha layana* or five-celled dwelling. It is in two parts, a middle hall and five cells. The middle hall is 17' 10" square and 7' 3" high. Its front wall is broken but traces of the doorway, 4' 6" broad and 7' 3" high, remain. The floor and walls are well paved and smoothed. Of the five cells two are in the left wall, one in the right wall, and two in the back wall. Of the two left wall cells, the left cell is 7' x 7' x 7' and the right cell is 7' 8" x 7' 5" x 7' 6". The front wall of the right cell and the partition wall of the two cells are broken. Of the back cells, whose floor is about 3" and ceiling about 5" higher than the hall floor and ceiling, the left cell is 7' 9" x 7' 6" x 7' 10" and the right cell 7' 7" square and 7' 8" high. The right wall cell, on the same level as the back cell is 5' 9" x 7' 6" x 7' 8". The doorways of all the cells are about 2' wide and 7' 6" high, and all have grooves for wooden frames. Except the right wall cell all have holes in the side walls. The hall ceiling projects a little, and under the same ceiling, to the left of cave I. is an excavation (6' x 5' 9" x 7' 8") with the front and part of the left wall broken. It may be a separate cell.

Cave II.

Cave II. close to the right of cave I. is a chapel cave and differs in its round plan from all other known chapels in Western India. It has a round floor, and in the middle of the floor the relic-shrine or *daghoba* with, round it, a circle of twelve plain octagonal pillars. An aisle runs all round between the pillars and the walls. The doorway in front is broken but from a part which remains on the left it appears to have been very broad. The relic-shrine or *stupa* in the middle of the circular floor is twenty-five feet in diameter. It consists of a plain drum-like plinth with, upon it, a rather elongated semicircular dome, differing from the flat and round domes of the other Junnar chapels. The plinth is 4' 4" high and 25' 5" round and the dome 5' 2" high and 22' round. The dome does not seem to have had a large capital but a small plain capital like a plate, part of which is broken. In the middle of the plate is a hole, 7" square and about a foot deep, probably to support the umbrella. Both the plinth and the dome are cracked. About four feet from the *stupa* is a circle of twelve plain octagonal pillars well smoothed and polished and each 11 feet high and about 1' 7" in diameter. Traces show that the pillars were painted more richly than those of and other of the Junnar caves. Between the pillars and the round wall runs the aisle about 4' broad. The cave ceiling or roof is dome-shaped like a hollow half globe placed over a circle, and supported on the pillars over a circular beam about 5' thick and 2' broad. The aisle roof inclines from the top of the beam over the pillars. The wall all round is about 9' 2" from the floor.

The whole cave appears to have been painted. In the aisle roof, in the lower circle of the dome roof, and on the pillars, patches of colour are still left. Much of the wall to the right of the doorway is lost. From what remains of the left wall there appears to have been a doorway between two large windows 7' high and 1' 7" from the floor. The windows

appear to have had grooves for wooden frames. The front of this cave is masonry built and a court in front of it, twelve feet wide, is protected by a masonry wall.

Cave III

Cave III. close to the left, is a small dwelling, originally in three parts, an open narrow veranda with a cell to the right, a middle room, and two cells in the back wall. The cave has been made into a shrine of the goddess Tulja. The partition and front walls of the two back cells have been broken, and in the right wall of the right cell is cut an ugly figure of the goddess 3' high with eight hands and riding a lion. Her first right hand holds a dagger and rests on her hip, her second holds a trident, her third a sword, and her fourth the tail of the lion. The first left hand holds the lion's head, the second a shield, the third a bow and arrow, and the fourth a mace. On her neck is a necklace and on her head a crown. In front is a small altar of dressed stones 1' 8" broad and 1' 5" high, and over the altar are two modern pillars with a Moghal arch over them. In front of the shrine is a tortoise carved out of the base of the partition wall. The floor has been dressed and slightly sloped.

Cave IV.

Close to the right is Cave IV. a row of three cells. The partition walls of the three cells have been blown away with gunpowder, probably to make a good sitting hall near the shrine of the goddess. The front of the cell floors has been broken and closed with modern masonry.

Cave V.

Cave V". close to the right of cave IV. is a small cell on a rather unusual plan. The doorway, 2' 5" wide, leads to a small passage 7' deep 3' 5" broad and 7' high and the passage to a cell 7' square and 7' high.

Cave VI.

Cave VI. close to the right of cave V. consists of two cells side by side. The cells are on the same level and are equally well dressed. The first cell is 7' square and 7' high, and in each of its side walls three holes face one another, probably to support a wooden bench. The doorway is 2' 3" wide. The second cell is 7' square and 7' high. The front of the veranda of both is entirely broken; both are hard of access.

Cave VII.

Cave VII. is close to the right of cave VI. As the partition wall between it and the right cell of cave VI. is broken, the two Cells appear as one. But the horse-shoe arch and other ornament in front over its doorway marks it a separate cave. It is 7' 6" square and 7' 6" high. Its left and front walls are broken. Over the doorway, resting on ribs, is a horse-shoe arch. On the front face of the arch is some ornamental work. Below the arch over the

doorway is lattice work carved as in Manmoda cave XXXVI. [See above p. 181.] Above the lattice work is a small pentagonal symbol. By the side of the main arch are two small arches, and between the main and each small arch is some lattice work. By the side of each small arch is cut a relic-shrine in half relief with an umbrella. To the left of the relic-shrine is a man bowing and on the right a man and woman approach the relic-shrine. On either side high up is an angel floating to the shrine. Near the right relic-shrine stands a Naga Raja and above a floating angel. Higher up a band of rail pattern extends along the entire ornament.

Cave VIII.

Cave VIII. close to the right of cave VII. consists of two cells. side by side. Their front, partition walls, and floor are broken. Both cells are almost entirely gone and have nothing of interest.

Cave IX.

Cave IX. close to the right of cave VIII. is a dwelling with two cells, with their partition and front walls broken. The left cell is 7' 6" x 7' 9" x 7' 7" and the right 7' 8" x 7' 7" x 7' 10". In front, over, the doorway of each cell, two horse-shoe arches rest on ribs, and; between the two arches and on their sides is the rail pattern. Below each arch in the wall is semicircular lattice work. By the side of each large arch is a small arch, and between all the arches is lattice work in the round pillow fashion. Over the entire sculpture is a band of rail pattern.

Cave X.

Cave X. close to the right of cave IX. is a dining hall or *bhojanamandapa*, 23' 2" broad 30' deep and 8' 5" high, without a front wall. Along the back right and left walls is a bench. In the right wall, near the front, is a cell 10' 1" broad and 7' 10" deep, probably the kitchen or the place for doling out their meals to the monks. To the left is a broken cistern and to the right five cisterns filled with earth.

Cave XI.

About fifty feet further to the right is Cave XI. a dwelling two parts, a passage and a cell in the left wall. The passage has a bench along about half its left wall and another in a recess in the back wall. To the left of this cave are some excavations entirely filled with earth brought by the rains.

Ganesh Lena Caves.

In the long range that bounds Junnar to the north, part of which is known as the Hatkeshvar and part as the Suleman hills, one chief spur about a mile to the north of the town ends in a great rounded scarp about a hundred feet above the plain. This scarp has been cut into a long row of caves, the chief of which, one of the largest caves in Western

India, has been turned into a temple of Ganpati and given the group the name of the Ganesh Lena or Ganesh Caves. The way to the caves is through the north part of the town, across the Kukdi, through some rich garden land with sugarcane plantains and rich-leaved mangoes and tamarinds, up the under slopes of the hills, most of the way shaded by mango trees, said to have been planted by Amritrav, the adopted son of Raghunathrav the sixth Peshwa (1773 -1774) and with some rich garden land on the west.

Nearly a quarter of the way up the hill side is made easy by ten flights of forty-five modern steps of well dressed masonry built in detail by people whose prayers the god Ganpati has granted. Above, the path is steeper in places with rough masonry and undressed stones or old rock-cut steps. The caves look out over the bare lower slopes of the hill with rock and bleached grass broken by patches of rich garden land, to the river whose course is marked by tree and gardens. Behind the river are the houses and trees of Junnar, and beyond, the waving out-line of the Manmoda hills. To the south-west stands the block of Shivner with its great natural bastions and rounded top, and to the west the Kukdi valley with scattered trees and garden hollows bounded by the east face of the Tulja range. Beginning from the east or right, Cave I. is a dwelling in four parts, a veranda, a middle room, a cell, and a half cell. The veranda is 3' 9" deep 14' 11" broad and 7' 2" high, with, along the right wall, a bench 3' 6" long 2' 5" broad and 2' 5" high. Its front appears to have had two quadrangular pillars of one of which a trace remains in the ceiling. Over the pillars rested the rock beam, over the beam project ribs, and over the ribs in front was the rail pattern which is now lost. Below the veranda, in a recess to the right, is an earth-filled cistern. A doorway 2' 6" broad and 6' 10" high, with a small window to the left, leads into the middle room. The middle room is 5' 8" deep 12' 6" broad and 7' high and along its right wall has a bench 2' 5" broad 5' 8" long and 2' 5" high. In the back wall to the left is the half cell and to the right the cell. The half-cell is 3' 8" broad and 8' 3" deep, and along its right wall has a bench 2' 4" broad 7' long and 2' 5" high, with, in the left wall facing the bench, a window 2' square communicating with cave II. A door, 2' 4" broad and 6' 3" high with grooves for a wooden frame, leads into the cell which is 9' broad 7 deep and 6' 10" high, with, along its right wall, a bench 7 long 2' 6" high and 2' 5" broad.

Cave II.

Cave II. close to the left or west of cave I. is almost on the same plan as cave I. only differing in the position of the cell and the half cell. In front is a veranda 11' 8" broad 3' 8" deep and 7 high, with, in front, two pillars and two pilasters of which the right pillar and pilaster are partly broken. Between each pillar and pilaster is a bench with curtains on the back, the right curtain broken. On the front or south face of the curtain is the rail pattern. Over the pillars rests the rock beam and over the beam the ceiling. In front over the beam project rock imitations of rafters, their ends standing out from a thinner stone beam. Over the beam in front is the rail pattern, and over the rail the rock projects about two feet.

A doorway, 2' 3" wide and 5' 9" high, with grooves for a wooden frame, leads into a middle room 15' broad 8' deep and 7' high, with, along the entire left wall, a bench 2' 8"

broad and 2' 5" high. In the back wall to the left is the cell, and to the right the half cell. The cell is 9' 7" deep 6' 8" broad and 7' high, and along the entire back wall, is a bench 2' 7" broad and 2' 5" high. The cell door, with grooves for a wooden frame, is 2' 6" broad and 6' 7" high. The half cell is 4' 4" deep and 2' 9" broad, with, along the back wall, a bench 2' 5" broad and 2' 3" high.

Cave, III.

Cave III. close to the left of cave II. is a small dwelling consisting of a cell and an open veranda. The veranda is 15' 11" broad and 5' 7" deep, and in front of the doorway has, along the entire back wall, a bench 1' 6" high and 2' broad. A door, 2' 6" wide and 6' high, leads into a cell 8' deep 8' 4" broad and 6' 11" high, with, along the left wall in a recess 7' 4" long 2' 6" broad and 4' high, a seat 2' 6' high as long and broad as the recess. In front of the recess, below the seat, are vertical bands. Between caves II. and III., in a recess in front, is a seat.

Cave IV

Cave IV. close to the left of cave III. is a dwelling consisting of a cell and an open veranda. The veranda is 16' 3" broad 5' 8" deep and 8' 3" high and, along its back wall, in front of the doorway has a bench 2' broad and 1' 6" high. In the bench close to the right of the doorway is a small hole, probably for water to wash the feet before entering the cell. A grooved door, 3' 5" wide and 7' 5" high, with a partly broken window to the left, leads to the cell which is 16' 3" broad 10' 10" deep and 8' high, and along its entire right wall has a bench 2' broad and 2' 2" high.

Cave V.

Cave V. to the left of cave IV. is about twelve feet lower. It is a seven-celled dwelling or *saptagarbha layana*. It is in three parts, a veranda a middle hall and seven cells, three in the back wall and two in each side wall. The middle hall is 29' 4" deep 26' broad and 8' 5" high. Along the back and side walls in front of the cells runs a bench 1' 9" broad and 1' high. The doorway is 5' 3" broad and 8' 5" high, and about two feet on either side is a window 2' 6" high and 2' 3" broad. The seven cells vary in depth from 9' to 10', in breadth from 7' to 8', and in height from 6' to 7'; and each has a bench in the back wall. The veranda is 19' 8" broad 6' deep and 9' 1" high and had two pillars and two pilasters with pot capitals of the Satakarni period (B.C. 90-A.D. 300), of which only the right broken pilaster and a trace of the base of the right pillar remain. Much of the veranda ceiling has been broken. In front of the veranda, an open court with two steps leads to the veranda. To the right of the court is a cistern. In the back wall of the veranda, to the left of the doorway, close under the ceiling, is Inscription 30 well carved in one line. In the beginning is the Buddhist trident and at the end the *svastika* or lucky cross. The inscription may be read:

Inscription 30.

Dhanikaseniya Satagabham podhi cha deyadhamam and may be translated 'A meritorious gift of a seven-celled cave and cistern by a guild of corndealers.'

To what place the guild belonged is not stated. It was probably Junnar.

Cave VI.

Cave VI. close to the left of cave V. is a chapel cave or *chaitya vihar*. In its general inward plan it is much like Ajanta cave IX.[Compare Bombay Gazetteer, XII. 535 - 539.] It is entered by five steps and consists of a veranda with pillars and pilasters and a shrine. The shrine or chapel measures 43' 8" by 22' 8" wide and on each side has a row of five pillars and one pilaster with side aisles 3' 8" broad and a central relic-shrine or *chaitya* near the back of the chapel. The pillars are of the Satakarni period (B.C. 90 - A.D. 300) with eight-sided shafts and waterpot bases and capitals. The pillars begin with bases of four plates, each smaller than the plate below, then a waterpot, above the pot an eight-sided shaft, above the shaft a reversed pot, then a capital in five plates, and on the top a belt in the *amalaka* or cogwheel pattern. [The details of the pillars are: whole height 10' 11"; each of the eight facet of the shaft about 7' circumference, of the shaft 5', the base 1'; lower pot 1' 10"; the shaft 4' 7"; the inverted pot 1' 7"; a square plate 2', an *amalaka* belt 3 ½"; the plate capital 10", and the animal capital 2' 9".] Except the right pilaster all have figures of animals on the capitals sitting with inverted faces. On the left, above the pilaster next the door, is a lion, on the first pillar are two elephants, on the second pillar a sphinx and a lion, [The head of the lion is broken; the feet of the sphinx are like the hoofs of a ball and the face human with ear ornaments.] on the third pillar two elephants, on the fourth two tigers, and on the fifth two elephants. On the right side the pilaster next the door has no animal capital, the first pillar has two elephants, the second two tigers, the third two well carved elephants, the fourth two tigers, and the fifth two elephants. Hollows in the fronts of the pillars are probably the result of an attempt to break them in search of treasure. Behind the relic-shrine, in a curve, are six eight-sided pillars. The aisles are about 3' 8" broad and 12' high. The walls go up straight 7' 6", resting on a beam above the backs of the animal capitals, and above that rise in a pointed arch about 4' 8", the whole height to the centre of the vault being 24' 8". Along the roof are stone imitations of vaulting wooden ribs as at Karle, thirteen on each side and six at the back. Between each pair of stone ribs is a hole as if for something wooden. Part of the seventh rib on the right side has broken away and been mended with wood which has disappeared. The side aisles have their ceilings marked with stone ribs like the central roof.

The relic-shrine or *daghoba* is in shape much like the relic-shrines of the Gotamiputra period (A.D. 35-1507) with round domes. The plinth, which is 4' 7" high and 27' 7" round, is ornamented at the foot with a thin round plate, and at the head with a 4" band with forty-five projecting teeth, and over the band a 2" moulding surmounted by a 1' 1" band of rail pattern. Over the rail band is a terrace 9" deep, and above is the dome nearly three quarters of a circle, 26' round and 6' 5" high of which 5' 3" show above the rail. Above the dome is a small block 6' high 3' broad and 2' 6" long, and above the block a quadrangular shaft 2' 6" broad 2' 1" long and 1' 9" high with rail pattern. The shaft

supports a tee in six square plates, each plate bigger than the plate below, measuring altogether about 3' 1" high. The sixth or top plate is 5' 8" square, and over it is a seventh square plate about 2" bigger than the sixth plate and about 7" thick. On the front face of the seventh plate, on the two corners, are two half pyramids and in the middle four whole pyramids, each pyramid in shape like five plates laid one over the other, each upper plate larger than the plate below it. Between each pair of pyramids are five well executed and ornamented Buddhist tridents. In front of the relic-shrine is a hole for garlands. On the top are a central and four corner holes about a foot deep. The central hole was probably for a wooden umbrella which has disappeared, and the side holes for flags.

The door of the chapel is 5' 11" broad 9' 2" high and 2' thick, and has sockets for a large wooden frame above and in the floor. On the left door face are symbols, or perhaps letters, which have not been understood or identified. The veranda is 20' 8" long 6' 8" broad Mid 12' 4" high. In front are two pillars and two pilasters in the same style as the chapel pillars except that the belt of cogwheel pattern is protected by a square open boxlike section. The pilasters and pillars have animal capitals on the inner and outer faces. The pilasters have each a single tiger and the pillars two elephants facing each other. The elephants, which seem to have had riders, and the tigers on the outer faces are spoilt. Above the animals the roof projects a little but is now greatly broken. Above is the rail pattern and above the rail the arch. On either side of the arch the work is unfinished.

Inscription 31.

On the back wall of the veranda, under the ceiling and above the doorway, is Inscription 31 in large deep cut letters and well preserved. The inscription reads: Kalianasa Heranikaputasa Sulasadatasa ekapurisasa chetiyagharo niyuto deyadhama and may be translated

' A meritorious gift of a chapel cave by the distinguished Sulasadata, son of Heranika of Kalya'na.'

The inscription shows that this chapel is the gift of one Sulasadata son of Heranika of Kalyana in the Thana district. The name Heranika is from Sk. Hairanyaka and may also mean a goldsmith. But as ' son of' is mentioned, Heranika is probably a proper name as, if he was a goldsmith by profession, he would simply be called a goldsmith and not designated son of a goldsmith. The inscription begins and ends with the well known *svastika* mark.

Between this and cave V. on a rather high level, is an excavation originally intended either for a dwelling or for a seat. On its left, side is a bench. As the builders came across a fault in the rock, it' has been turned into a cistern.

Cave VII.

Cave VII. close to the left of cave VI. on a slightly higher level, is the largest of the Junnar caves. It is a large hall without pillars or other support, 57' long by 51' broad and

11' 1" high, in plan much like Nasik cave X. The difference between the two is that the Nasik cave has a *daghoba* or relic-shrine in half relief between the third and fourth cells in the back wall, while this cave has no relic-shrine. If this cave once had a small relic-shrine all trace has been removed, as the third and fourth cells in the back wall have had their partition wall broken away and been made into a Ganpati shrine, and the front walls have been broken and a large doorway, as broad as the two old doorways, has been opened. It is therefore possible that like Nasik cave X. this may have once had a relic-shrine. The cave is in three parts a hall, twenty cells, and a veranda. The hall is 57' deep 51' broad and 11' 1" high. Half of the hall wall have been plastered with clay, whitewashed, and daubed with modern paintings, chiefly of Devi, Krishna, Narayan, and Shiv on the left wall; and on the back wall scenes in Krishna's life, a Yogi, Ganesh, Garud, Hanuman, the marriage preparations of Ganpati, and in a recess a two-headed and four-handed Ganesh and his fight with a Rakshas. The right wall has paintings of Ganpati's childhood, his Hallisaka dance, himself in the middle and women around him, and Ganpati's procession on his rat-carrier. All along the side and back walls runs a bench 1' 10" broad and 1' 6" high.

Carved on the left wall, between the cell doorways, are nine Sati monuments of later times and worthy of note as typical North Deccan Sati memorials. In shape each is like a long pillar with an arched top. Three of the monuments are plain without sculpture, the other six have sculptured panels. To the right of each of these pillars is a hand raised above the elbow, with the palm open, in token of the Sati's blessing. The panel sculptures are mostly worn away and spoilt, but the first engraving from the right clearly shows what they originally were. It is in three panels. In the lowest panel the Sati is shown burning with her husband's body, supporting his right hand and leg on her lap. Flames rise from the pile. The middle panel shows the Sati going on horseback to the funeral pile. Her hands are raised over her head and she rides to her death apparently in high spirits. [The progress of the Sati to the funeral pile was formerly marked by several special practices. In some places she went to the burning ground richly dressed, scattering money and flowers, and calling out the name of God, with music sounding and drums beating. In some parts the Sati used to mark with her hands the gateways and walls of the chief temple or the chief gateway. She also marked with her hand-marks some stone in her house for her family to worship, and on this stone it was usual for her children or relations to cut the original out. In honour of Satis well-to-do people, chiefly Rajputs, used to build *chhatris* or shades in temples and at burning places. In some parts, as at present in Nepal, a wooden seat, called *pat mandvi*, is prepared to carry her, the seat and her silk robe going as coveted presents to the state. In other parts of the country, as shown in this memorial, she was carried on an elephant or on horseback. The arrangements for the pile also varied. In Gujarat and Cutch the wife sat in a specially built grass hut, and keeping her husband's head on her lap supported it with her right hand, while she kindled the hut with a torch held in her left hand. At present in Nepal the husband and the Sati are made to lie side by side on the pile. The woman's right hand is put under the husband's neck, and round the woman's face are placed inflammable materials, camphor, resin, nitrate of potash, sulphur, clarified butter, oil, and grass. Three long poles of undried wood are laid over the bodies, one over the legs, the second over the chest, and the third over the neck. Three men on each side press down the poles until

the woman is burnt to death. In one instance, when the poles were carelessly held, a Brahman Sati ran from the pile and crossed a river, but was brought back by her friends and burnt.] The topmost panel shows the woman worshipping Mahadev with her husband. These Sati memorials are of about the time when the cave was dedicated to Ganpati, and the memorials were carved here as it was a holy Brahmanical shrine, the Ganpati of this cave being regarded as one of Ganpati's eight chief forms or *ashtavinayakas*. [See below Ojhar.] Along the right and left walls are seven cells each and six along the back wall making twenty as at Nasik. Of the back cells, the middle two have had their partition walls broken as also the benches along their back walls. In the middle, in the vacant space between the old benches, is carved 'a rude image of Ganpati with a thick coating of redlead and clarified butter which people have been pouring for centuries. Over Ganpati is a wooden *mandap* plated with brass, the gift of Junnar Brahmins. The shrine doorway, made of two cell doorways, consists of lattice work on either side, and in the middle a small wooden door. The bench in front has been cut down into a step. Except the shrine all the back cells are closed with wooden doors and used as store-rooms. The side cells vary in size from 8' to 9' 6" deep, 7' to 8' broad, and about 7' high, and have each a grooved doorway about 2' 6" wide. Except the sixth right wall cell and the first and sixth of the left wall, all the cells have benches along the back wall, 2' 8" high and 2' 4" broad.

The hall is entered by a large middle doorway and two smaller side doorways with, between the middle and each side doorway, one large window. The middle doorway is 7' 4" broad and 11' 2" high, the left side door is 2' 7" broad and 7' high, and the left window 6' long and 4' high. The right side door is 2' 8" broad and 7' high, and the right window is 6' long and 3' 10" high. The middle and side doorways are grooved for wooden frames; the sockets in the middle doorway are for a very large door.

The veranda, which is 44' 6" broad 7' deep and 12' 7" high, has, in front six pillars and two pilasters, and between the two middle pillars is an opening leading from the veranda into an open court. Between each pillar and side pilaster is a bench, 1' 7" broad and 1' 4" high, with the pillars over them and curtains 1' 5" high behind them. On the back of the curtain is the rail pattern and below the rail pattern vertical imitations of wooden bars. The pillars have octagonal shafts and over the shafts pot capitals of the S'atakarni type. Over the outer face of the capitals are animals now mostly broken. Going from the right to the left, on the first pillar are two lions, on the second pillar two bulls, on the third pillar two elephants with riders, on the fourth pillar two elephants with riders, on the fifth pillar two bulls, and on the sixth pillar two tigers. The pilasters have each two tigers. On the left bench are cut three large holes or *kundis*, with small exit holes fitted with small wooden or metal pipes, and closed with temporary stoppers, being intended to allow water from the holes to wash the feet of visitors. The veranda ceiling, which is marked with ribs, projects a little in front of the pillars and over the ceiling stands out the roof with the rail pattern on its front. Most of the open court in front of the veranda, which is as broad as the veranda and about 5' deep, is broken. To the right of the court several steps are cut from under the rock. As most of the court floor is broken, the passage by the steps is unsafe, and modern steps have been cut to the right of the veranda and joined with the old steps below. Below the court are five cisterns, one of which holds water.

Cave VIII.

Cave VIII. a little to the left of cave VII. and on the same level, is a dwelling cave difficult to reach. It consists of a veranda with a cell and a half cell in its back wall. The roof and left side wall of the veranda are almost entirely broken, but enough is left to show that the veranda was 19' 4" long by 5' 4" broad and 6' 7" high. A broken door with a small window to the right leads to the cell, 6' 10" deep 9' 1" broad and 6' 7" high, with a benched recess to the left, 6' 3" long 2' 6" broad and 3' 1" high. In the back wall near the extreme right end, is a peg hole. To the right of the cell, entered from the veranda, is the half cell 12' 1" long and 4' 3" broad. The half cell has an open front and a bench in the back wall 3' deep 4' 3" broad and 2' 3" high.

Cave IX.

Cave IX. is close to the right of cave VIII. the way to it being from the veranda of cave VIII. It appears to have had a front entrance but the rock is broken. The cave is a large hall and a veranda. The hall is 31' 7" broad 23' deep and 9' high, with, in the middle of the front wall, a large doorway 6' broad and 8' 10" high and a side doorway on the left 3' broad and 8' 8" high. Both doorways have grooves in the floor for wooden frames. On either side of the middle doorway is a window, the left window 4' broad and 5' high and the right window 4' 3" broad and 5' high. The veranda floor is two feet lower than the hall floor which has two steps. The veranda is 31' 6" broad and 5' 3" deep and had four S'atakarni pillars of which the broken bases remain. It is hard to say for what purpose the hall was used, except perhaps, as a school or study. It differs in plan from dining halls or *bhojanamandapas* which have benches along the side and back walls and no front wall. It is not a *layana* or dwelling cave as it has neither cells nor stone benches, and it is not a shrine as it has no object of worship.

Cave X.

Cave X. to the left of cave IX. but on a higher level, is difficult to reach as its front is broken. It is a dwelling consisting of an open veranda, a middle room, and in the back wall of the middle room a half cell and cell. The veranda, with broken floor and ceiling, is 22' 10" broad and 6' 4" deep. A grooved broken doorway, 4' 5" wide and 6' 4" high, with, on either side, a window each 2' 1" square, leads to the middle room which is 18' broad 5' 6" deep and 7' high, and in the right wall has a recess 2' 3" broad and 4' high with a seat 2' 6" high. To the left, in the back wall of the middle room, is a cell 9' 3" deep 3' 11" broad and 7' high, with, along its back wall, in a recess 3' 8" long 2' 5" broad and 4' high, a seat 2' 6" high. A doorway, 2' 8" wide and 6' 10" high, leads on the right to the cell which is 8' deep 8' 4" broad and 7' high, with, on the left, a recess 2' 3" broad 7' long and 4' high with a seat 2' 9" high. Traces of painting remain on the ceiling. Outside the veranda to the left is a cistern.

Cave XI.

Cave XI. close to the left of cave X. and rather hard to reach, is a hall 15' 2" deep 23' broad and 7' 10" high with a broken front. In the left wall is a cell, 5' 10" deep 6' 10" broad and 7' high, its floor 6' higher than the hall floor, and its ceiling 5" lower than the hall ceiling. It has a grooved doorway 2' 7" wide and 6' 10" high. In the back wall is a recess, 6' long 2' 8" broad and 4' 6" high, with a seat 2' 4" high. Traces in the ceiling show that the cave was painted. Outside, about four paces to the right, is a recess with a view seat.

Cave XII.

Cave XII. close to the left of cave XI. is a small dwelling entered by a door from the veranda of cave XI. It consists of an open veranda, a middle room, and in the back wall of the middle room a half cell and cell. The middle room, which is entered by a doorway 3' wide and 7' 1" high with a small window 1' 6" square to its left, is 12' 8" broad 5' 8" deep and 7' 3" high, and in its right wall has a seat recess 5' 4" long 2' 7" broad and 4' 6" high, the seat 2' 7" from the floor. To the left, in the back wall of the middle room, is the half cell 7' 8" deep 3' 2" broad and 7' 1" high. In its left wall is a seat recess 6' long 2' 6" broad and 4' high, the seat 2' 4" from the floor. The ceil is 7' deep 6' 11" broad and 7' high with a grooved doorway 2' 8" wide and 6' 10" high. The veranda, whose floor and ceiling are partly broken, is 19' 3" broad and 5' deep. In the back wall of the veranda, to the left of the doorway, is a bench 5' broad and 1' high, and to the right of the doorway, a seat recess 5' 5" long 2' 5" broad and 3' 11" high, the seat being 3' high. The cave was painted, and concentric circles of painting are still seen in the ceiling of the middle room. The middle room floor and half of the cell floor has an inch-thick coating of excellent cement much of which is damaged.

Cave XIII.

Cave XIII. close to the left of cave XII. but on a slightly higher level, is a small dwelling in four parts, an open court, a veranda, an inner room, and in the back wall of the middle room a cell and a half cell. The middle room is 12' 5" broad 7' 9" deep and 7' high with, along the right wall, a bench 2' 7" broad 2' 7" high and 7' 9" long. The ceiling has remains of painting. To the left is a seat recess 2' 5" broad 7' 4" long and 4' 4" high, the seat 2' high. In the back wall to the left is the half cell, 10' 3" deep 5' 7" broad and 7' high, with a bench in the right wall. The cell is 7' deep 6' 4" broad and 7" high with a grooved doorway 2' 5" wide and 7' high. The main doorway is 2' 9" wide and 6' 11" high and has grooves for a wooden frame. To its left is a window 2' 2" square. The veranda is 16' 4" broad 4' deep and 7' 1" high and has, along the right wall, a bench 4' long 2' 6" broad and 2' 3" high. In front of the veranda were two benches, 1' 4" broad and 1' 3" high, with curtains now broken. Over each end of each bench rested a plain eight-sided pillar and pilaster, of which the right pilaster and part of the right pillar remain. On the right pilaster is the double crescent ornament. , The court in front, from which two steps lead to the veranda, is 13' 8" broad and 6' 6" deep. To the right of the court is a dry cistern.

Cave XIV,

Cave XIV. close to the left of cave XIII. is a chapel cave or *chaitya vihar*, quadrangular, with a flat roof. The shrine is 12' 11" broad 22' 2" deep and 13' 8" high, with a grooved doorway 5' 11" wide and 11' 11" high. The relic-shrine is twelve feet from the doorway. Its plinth is 4' 9" high. At the foot are three round; plates each smaller than the one below it, and above the plates a drum 21' 3" in circumference. Above the drum is a row of thirty-two teeth, and above the teeth a one-inch moulding which completes the plinth. Above the plinth is a band of rail pattern 10' high, and above the rail band a round dome 3' 9" high and 20' 7" in circumference. Above the dome is a square shaft with rail pattern 10' high and 1' 10" broad, and above the shaft is a five-plated tee about, 1' 7" high, the top plate 4' 5" square. Crowning the whole is an umbrella cut out of the ceiling. In front of the shrine is a veranda 10' 9" broad and 2' 9" deep, with, in front, on a space 2' 6" broad, two S'atakarni pillars and two pilasters, on which rests a beam. Above the beam ribs project from the ceiling. In front of the veranda a court, 20' 2" long and 9' broad, is entered by four steps three feet below the veranda. The left wall of the court has a broken relic-shrine or *daghoba* in half relief and the same wall had a doorway leading from the veranda of cave XIII. In the back wall of the veranda, to the left of the doorway under the ceiling, is Inscription 32 very well cut in two lines. The inscription reads:

Inscription 32.

(1) Kapila upa'sakasa natuno ta'pasa upa'sakasa

(2) putasa a'nadasa deyadhammam chetiya'gharo niyuto

and may be translated

A meritorious gift of a chapel cave given by A'nanda, a son of Ta'pasa an Upa'saka, and grandson of Kapila an Upa'saka.'

Cave XV.

Cave XV., close to the left of cave XIV. on a higher level, is a small dwelling consisting of a cell and a veranda. The cell is 7' 11" broad 7' 9" deep and 7' high with an unproved doorway 2' 7" wide and 6' 2" high. The veranda is 16' broad 6' 3" deep and 6' 3" high. The side walls are preserved but the ceiling is half broken.

Cave XVI.

Cave XVI. close to the left of cave XV. on a slightly higher level, is a small dwelling consisting of a cell and a veranda. The cell, which is 8' 4" deep 10' 8" broad and 6' 11" high, has, along its right wall, a bench 2' 5" broad and 2' 7" high. The doorway is 2' 11" wide and 6' 5" high. The veranda is 11' 11" broad 3' deep and 6' 6" high. Both the side walls and part of the ceiling are broken.

Cave XVII.

Cave XVII. close to the left of cave XVI. consists of three small dwellings which look like separate caves but they are in one row in the same veranda. The first dwelling is in two parts, a middle room 12' 11" broad 5' 3" deep and 7' 4" high, with a doorway 2' 11" broad and 7' 4" high, and on either side of it a broken window. In the back wall is a cell to the right and a half cell to the left. The cell is 7' 6" broad 7' 5" deep and 7' 4" high, with a door 2' 10" wide and 7' 4" high, and to the left of the door a window. The ceiling has remains of painting. The half cell is 4' 8" broad 7' deep and 7' 4" high with a bench 2' 7" high and 3' broad. The bench ceiling is 8' lower than the hall ceiling and projects a little in front of the bench. The second and third dwellings are close to the left of the first dwelling. A soft layer of clay has cut off much of the upper part of the cave but what remains is well preserved. The second dwelling is in two parts, a middle room, a half cell to the left, and a cell. reached from the. right of the half cell. The middle room is 7' deep 15' broad and 7' high, with, along the right wall, a bench 2' 5" broad and 2' 5" high. The doorway is 3' 4" broad and 6' 10" high. The half cell is 4' 6" broad 13' 8" deep and 7' high, and in its back wall has, in a recess 2' 5" broad 4' 6" long and 3' 8" high, a bench 2' 5" broad and 2' 3" high. A grooved door in the right wall of the half cell, 2' 7" broad and 6' 8" high, leads to the cell 7' 4" broad 7' 4" deep and 6' 8" high, with, along the back wall, a bench 2' 4" broad and 2' 7" high. In the right wall was a window looking over the middle room. In front of the doorway is a bench 1' 8" broad and 1' 8" high. The third dwelling is the largest of the three. It consists of a middle hall, and, in the back wall of the hall, two cells and two seat recesses. The hall is 25' broad 15' 10" deep and 7' 4" high, and along the right and back walls has a bench 2' broad and 1' 10" high. The right cell is 7' broad 8' 9" deep and 6' 5" high with a grooved doorway 2' 8" wide and 6' 4" high and a window to the left of the doorway. The left cell is 7' wide 8' 6" deep and 6' 4" high with a grooved doorway 2' 6" wide and 6' 4" high and a window to the left of the doorway. Along the back wall of each cell is a bench 2' 2" wide and 2' 3" high. The seat recess at each corner of the back wall is 3' 8" long 2' 7" broad and 3' 3" high. The hall door was 5' 8" broad and 7' 4" high. In front of the hall door is a bench 1' 8" broad and 1' high. In front of the veranda are holes for. wooden pillars but much of it is broken. To the left of the veranda are two cisterns. Between this cave and cave XVIII. are three other cisterns. In the recess of the first cistern is Inscription 33. It may be read:

Inscription 33.

(1) Kalianakasa Kudiraputasa

(2) Suvanaka'rasa Saghakasa podhi deyadhammam

and may be translated

' A meritorious gift of a cistern by Saghaka a goldsmith, son of Kudira of Kalya'na.'

Inscription 34.

In the recess of the second cistern is Inscription 34. It may be read:

(1) Isimulasa'mino bhaya

(2) Nadaba'lika'ya Na'dakatorikasa

(3) Lachhinika'ya deyadhama podhi and may be translated

' A meritorious gift of a cistern by Lachhinika (wife) of Torika the Na daka [and] Nadaba'lika wife of Isimulasa'mi.'

Cave XVIII

Cave XVIII. follows the three cisterns. It is like a dining hall except that it has a front wall, with, in the middle, a grooved door, 5' 8' wide and 7' high and on either side of it a window 3' 3" broad and 2' 9" long. The hall is 29' 9" deep 24' 8" broad and 7' 4" high with a bench 1' 7" broad and 1' 2" high along the entire back and side walls. The passage to the hall is by three broken steps and on either side of the steps are broken benches 1' 8" high and 1' 8" broad. In front is an open court about 6' broad. Outside, to the left of the court, is a cistern of good water.

Cave XIX.

Cave XIX. about ten feet to the left of cave XVIII. is a cell without a front wall It is 13' 10' broad 9' 9" deep and 6' 4" high with, along the left wall, a bench 6' 9" long 1' 2" broad and 1' 1" high. The ceiling shows signs of a dressed stone or wooden screen from the right wall to the end of the bench. To the right is a small cell in the same roof probably connected with cave XIX. The cell is 8' deep 8' broad and. 6' 8" high, with, along the right wall, a bench 2' 2" broad and 2' 7" high. The grooved doorway of the cell is 2' 6' broad. The cave has two cisterns one to the left and another between it and the cell.

Cave XX

Cave XX., close to the left of the cistern, is a small dwelling hard to reach as the rock in front is broken. To the right is a passage 11' deep 3' broad and 7' high, and to the left a cell 10' 5" broad 10' deep and 7' high, with, along the entire left wall, a bench 2' 6' broad and 2' 7" high. The cell doorway is 2' 8" broad and 7' high.

Cave XXI

Cave XXI. close to the left of cave XX. is out of reach except by a modern hole cut through the cell of cave XX. It is a small dwelling consisting of a veranda and an inner cell. The cell is 10' broad 7' deep and 7' high, with, along the left wall, a bench 2' 1' wide and 2' 7" high. The cell door is grooved, 2' 7" wide and 6' 6" high. The veranda is 16' 5' broad and 4' deep. To the left, in the veranda, is a seat recess.

Cave XXII.

Cave XXII. close to the left of cave XXI. is a dwelling consisting of a veranda, and in the back wall of the veranda a half cell to the left and a cell to the right. The cell is 8' broad 6' 9" deep and 6' 8" high, with, along the entire back wall, a recessed bench 2' 4" broad and 2' 7" high. In the left wall a window looks into the half cell. The cell has a grooved door 2' 8" wide and 7' high. The half cell is 4' broad 9' 9" deep and 7' high. The veranda is 19' 5" broad and 5' deep, and in its back wall, to the right of the doorway, has a large seat recess with a seat 6' long 2' 10" broad and 3' high. In the left wall of the veranda are the remains of a doorway which led to an open sitting space 13' 9" broad and 5' deep with, in the back wall, a seat recess. To the right of the recess, under the ceiling, is Inscription 35 which reads:

Inscription 35.

(1) Sa'marupa'sakasa putasa

(2) Sivabhutisa deyadhama lenam

(3) Kapichite sanghasa niyutam ka?

and may be translated

'The meritorious gift of a dwelling cave by Sivabhuti the son of Samara an Upa'saka, dedicated to the Congregation of Kapichita' [Kapichita is probably the name of the monastic establishment in the Ganesh Lena hill.]

Cave XXIII.

Cave XXIII. close to the left of the open space, consists of a veranda and two cells in its back wall. The left cell is in two parts, a front room and a half cell in its back wall. The front room is 8' broad 8' deep and 7' 4" high, with a door 2' 7" wide and 6' 10" high. The half cell is 3' 3" broad 7' 10" deep and 6' 10" high, with, along its entire left wall, a recessed bench 6' 9" long 2' 8" high and 2' 6" broad. The right cell is 8' broad 8' deep and 7' 3" high, and in its back wall, in a recess 7' long 2' 7" broad and 4' high, has a bench 2' 5" from the floor. The cell door is 2' 6" wide. The veranda is 19' 6" broad and 3' 7" deep. Between the two cells in the back wall of the veranda, close under the ceiling, is a smoothed space 2' long prepared for, but without, an inscription. To the left is a recess-like excavation.

Cave XXIV

Cave XXIV. about a hundred feet to the left of cave XXIII. is very hard to reach as the rock in front of it is broken. A cistern is first reached, then a long seat recess, with, on either side of it, a small seat recess all three in an open sitting space. In the broken left wall of this open space, a broken door three feet wide leads to the veranda of cave XXIV. The cave consists of a veranda, and in the back wall of the veranda, to the right, a cell and to the left a half-cell. The cell is 9' 10" broad 7' 10" deep and 6' 10" high with a grooved

doorway 2' 7" wide and 6' 9" high, and along its entire right wall a bench 2' 5" wide and 2' 10" high. The half cell is 9' 9" deep 4' 1" broad and 7' 8" high, with, along its entire back wall, a bench 2' 8" broad and 3' from the floor. The veranda is 22' broad and 5' 7" deep with a bench along its left wall.

Cave XX V.

About 150 feet further to the left, almost inaccessible, is Cave XXV. with a cell, a broken open veranda, and a seat recess to the left. In the rough back wall of the veranda is the cell 10' deep 7' 10" broad and 8' high with a doorway about 5' 2" broad and 6' 2" high. A doorway, 2' 9" wide and 7' 4" high, in its left wall, leads to an inner cell 7' 8" broad 4' deep and 7' 4" high with uneven and irregular walls as further work was stopped by a flaw in the rock.

Cave XXVI.

About forty feet below cave VI. is Cave XXVI. a plain excavation consisting of an open veranda. Passing round the east end of this hill, after a walk of fully a mile, or about four miles from Junnar, in another spur of the Suleman hill, is a group of caves in the face of the hill about 400 feet above the level of Junnar. The caves face south-south west and are usually said to be difficult of approach, as the precipice in front of them is almost perpendicular. The most easterly cave of the group is a small *chaitya* or chapel cave 22' 4" long and 8' 2" wide. The relic-shrine, 15' 4" from the door, is 9' 4" in height and 4' 10" in diameter. The walls are not straight nor the floor level. The side , aisles have not been begun and, except the upper part of the relic- shrine or *daghoba*, almost no part of the interior is quite finished, The height of the cave is 16' to the top of the architrave or triforium and 18' 2" to the centre of the roof. Outside, the facade is carved with the horse-shoe or *chaitya* window ornaments, some enclosing a relic-shrine and others a lotus flower; while the rail ornament is largely interspersed in the usual way. The fronton round the window is also carved with a geometrical pattern. The general details of this cave seem to show that it is one of the earliest excavations at Junnar. Next to it, but higher up and almost inaccessible, are two cells, a well, and next a small dwelling or *vihara* with three cells two of them with stone beds. Some rough cutting on the back wall between the cell doors resembles a relic-shrine in low relief, but it is quite unfinished. Outside are two more cells and a chamber or chapel at the end of a veranda that runs along in front both of the *vihara* and the cells.

Trips.

Kukdi Vally.

From Junnar it is a pleasant trip sixteen miles west to Ghatghar, about two miles to the east of the Nana Pass. The road has lately been improved and is fit for bullock and pony carts. It winds up the Kukadner or Vale of the Kukdi, a broad flat valley whose bare sides rise gently to ranges of steep wildly scarped hills. At first, as in Junnar, the valley has Hatkeshvar and the Mangni hills to the north and Shivner and the Tulja hills to the south,

and between the two lines of hills rocky uplands and lower spurs, strewn with stones and white with bleached grass, are relieved by a few scattered trees, and nearer the centre of the valley, until the end of the cold weather, by hollows green with crops. On the left the Tulja hills are seen hid behind the lofty waving line of the Manekdho range. About six miles from Junnar the valley opens to the Nana Pass, Chavand, Shambhu, and part of the Jivdhan range showing on the left, and Hadsar, the Masherdi hills, and the worn tower-like crags of Anjanola on the right. Though the hill-tops change, the new hills differ little from the old, and, except that it is somewhat rougher, the valley remains much the same. The hill-sides are steep and bare, striped by level belts of rock standing like walls or dwarfed by banks of earth and stones washed from the upper slopes. The same rocky spurs and low plateaus fringe the valley and the general bareness is relieved by the same thin sprinkling of trees. The level parts of the valley yield crops during the rainy months, the main crop changing near Rajur, about eight miles west of Junnar, from millet to rice. In hollows near the river, till the end of the cold season, patches of bright green wheat, purple peas, or feathery blue-green gram are broken by the glistening thistle-like heads of *kardai* or safflower. The stream loiters in long shady reaches between banks whose hollows glow with rich ruddy grass. At Hiridi, about ten miles from Junnar, in the northern range, formerly hid by the Masherdi hills, appear the two-headed fort of Nimgiri, the long deeply scarped line of Devala, and the worn crags of Anjanola. In the south range, beyond the massive square block of Chavand, the lower castellated crag of Shambhu is dwarfed by the higher slopes of Karkumba. Behind Karkumba stands the steep shoulder locally known as Pahad, and beyond Pahad the lofty range which ends northwards in the fortified scarp of Jivdhan. From the middle of the plain, which separates Jivdhan from Anjanola, rise the bare slopes of a small hill and a little to the south a steep narrow point. The steep narrow point is the back of Nana's Thumb, and between it and the small hill to the north is the narrow cleft of the Nana Pass. About as far west as Hiridi the valley divides in two. A somewhat broken plain, about a mile broad, continues to stretch west about six miles to the head of the Nana Pass. This is generally called the Kukadner, but the stream which drains it is only a branch of the true Kukdi. The main stream turns to the left close under Chavand, crosses to the south between Chavand and Shambhu, and then winds west about four miles up a wild narrow valley ending in a glen shut in by high hills with woody terraces and green under-slopes. At the top of the glen, close under the western hills, in a thick *jambhul* and mango grove, on the right bank of the stream, is an old Hindu temple to Kukdeshvar, the god of the river. From the temple, across the west shoulder of Shambhu, a pleasant path leads along the north face of the Karkumba hills about five miles to Ghatghar. In the country to the west of Hiridi, in the broad or northern Kukadner, the valley is rougher than further east, the hill sides are much less bare, and the hollows and lower slopes and plateaus are in places richly wooded. In the two miles between Ghatghar and the Nana Pass the country is level and tame, redeemed to the north by the wild rounded crags of the Anjanola hill, and to the south by the great fortified block of Jivdhan, which is much like Shivner, except that the north end is squarer and blunter and that the upper hill is higher and larger.

Somewhat raised rocky ground seems to join the ends of the Anjanola spurs on the north and the Jivdhan spurs on the south. But there is said to be a break in the Anjanola spur and the drainage of the two miles beyond to the head of the Nana Pass winds north and

south and finally sets eastwards. In front is a line of low hillocks with grass and bushes and to the right the bare slope of the back of Nana's Thumb which does not rise more than 150 feet above the plain.

On the right of the low bank of hills to the north of Nana's Thumb is the pass called the Boranda Gate or *Borandache Dar*, which is fit only for men. The pass to the south of Nana's Thumb is called Guna and the pass to the north Nana. To the southeast the fine west scarp of Jivdhan ends south-west in a solitary rock pillar, about 200 feet high, known as the Monkey's Point or Vandrache look.

Nana Pass.

The ascent of the steep bare slope of Nana's Thumb from the east is easy but the sides are scarped crags. The Nana Pass is on the north side of the Thumb and the Guna Pass on the south. The distance from Ghatghar to the head of the Nana Pass is about two miles. A short distance before reaching the top of the pass the ground is covered with traces of houses which formed the old village, of Ghatghar. Among the stones that mark old foundations, a few yards to the west of the path, is a broken Hero Stone (2' 5" X 1') with four faces and three panels ten inches broad in each face. On the east face, in the lowest panel below, a dead man lies on the ground and above him a row of cattle shows that he met his death in a cattle raid. In the left of the panel, above, a figure, the corpse of the panel below, armed with sword and shield, fights two horsemen with spears. In the top panel is a central *ling* and two side worshippers, the one on the left sitting cross-legged, the one on the right standing and waving a lamp with his right hand and ringing a bell with his left. Above an angel bears a garland. In the south face, in the lowest panel, is a dead man with three cows above him. In the middle panel in the left, the corpse of the panel below, armed with sword and shield and with a big top-knot, fights two horsemen on the right with spears. Above two figures worship a *ling*, the left sitting and the right standing. In the west face the lowest panel has a dead man with a flying regal bearing a garland. In the middle panel one man on the left with sword and shield fights two men on the right with spear and shield. Above are Shiv and Parvati. In the north in the lowest panel is a dead man and two angels bearing a garland. In the middle panel on the right a man with sword and shield fights two men with spears and shields. In the top panel in the centre over a *ling* is an angel with side worshippers. About a hundred yards to the south of the Hero Stone, a stone belonging to a temple of Hemadpanti or pre-Musalman times, represents Mahalakshmi seated between two elephants.

The Guna Pass to the south of the Thumb is not now used, and though it is said to have been formerly practicable, there are no traces of any stair or other work without which it is impassable. It is a very narrow gorge with a deep drop on either side and a sheer wall of rock in front. Over the Guna Pass is a splendid stretch of the wild western front of the Sahyadris. Beyond a spur of Jivdhan that stands out to the south of the Guna gorge the deep cleft is the entrance to the Amboli Ghat and the high point or flat top behind is Dhak. Then the Sahyadris stretch to the west in great scarps that run down from Bhimashankar in sharp cliffs to lower slopes and plateaus deep in forest. To the west, between the Guna and Nana Pass, rises the back of Nana's Thumb whose sheer cliff is so

well known a land-mark from below. It rises steep and bare but of easy ascent about 150 feet with, a few steps beyond the crest, a sheer drop into the Konkan. The top commands a magnificent view of the great bend in the Sahyadris that stretches from the range that runs to the west near Kalsubai in Nasik to the Bhimashankar hills a distance of about sixty miles. The chief hill to the north is the great fort of Harishchandragad, with its regular wall-like bands of trap, one or two of them higher layers than appear in any of the neighbouring hills. To the south the chief peaks are Dhak and Bhimashankar. To the east between its two western guardians, Anjanola and Jivdhan, the broad level valley of the Kukdi stretches to the horizon. To the north-west, across the Konkan, stands out the Mahuli range with the great cleft and shattered pinnacles of Mahuli. To the south-west behind Shidgad, at the end of the Bhimashankar hills, are the level top of Matheran, the great comb like rock of Chanderi, and the cliffs and pinnacles of Bava Malang nearly hidden by the rounded top of Tavli. Near the isolated hill of Shidgad, at the point of the Bhimashankar hills, is the rough pass of Avapa whose difficulties and dangers Fryer, who was dragged up it in 1673, has so feelingly described.

At the top of the Nana Pass, on the right, is a platform (22' 9" x 15' 9") paved with old dressed stones and varying in height from 4' 5" on the west to 6' 7" on the east. In the south-west corner of the parapet is a great jar hewn out of the rock, about five feet high, with a heavy lid on one side of which is a hole through which apparently toll money was dropped. On the left, about ten feet above the path, nearly opposite the old toll-jar, a small cell now half full of earth is used as a temple of Ganpati, and about thirty paces to the south-west are three rock-cut cisterns in the open or pool style. The path, which varies in breadth from 16' 4" to 7, passes about 250 feet between two high banks of rock whose scarps seem to be partly artificial, though all traces of the chisel have worn off. About 250 feet from the toll platform, on each side of the path is a line of caves or rest-houses and water cisterns. Except two close to the path, the group of caves on the right has been so injured by the weather as to look little more than natural caverns. To the left, beyond a red modern figure of Hanuman the monkey god, over which is an old cistern, is a plain rough cave whose front wall and pillars have disappeared, whose floor has been broken and hollowed, and from much of whose sides and top the original surface has peeled. The cave was about 28' 7" square and 7' 10" high. The front of the cave may be traced by the remains of two square pilasters in the walls and by the square capital of one of the pillars which is still visible in the roof. The three sides of the cave were surrounded by a stone bench two feet broad and one foot seven inches high. Except in one or two places the bench has disappeared and the floor is rough and uneven almost like a natural cave. The whole face of the side walls was originally covered with writing in characters of about B.C. 100. The peeling of the outer surface of the wall has made many blanks and spoiled the meaning of a good deal of the inscription, still enough is left to place the general sense beyond doubt.

Inteription. B.C. 100.

The inscription may be translated:

Salutation to Dhamma (Dharma); Salutation to Ind (Indra); and salutations to Samkamsana (Samkarshana) and Va'sudeva, to the moon and the sun, to the five and the wind, to the four gods of the quarters, Tama, Varuna, Kubera, and Va'sava- The great prinoe, king Vedisiri (Vedishri) patient, valiant, whose army is never baffled, lord of Dakhina'patha (Dakshina'patha) the great warrior, the furtherer (descendant) of the Angiya (A'ngiya) dynasty, the first warrior on the earth which has the sea and great mountains for its garments, excellent performer of sixteen great sacrifices his (Vedishri's) father, the illustrious king with his queen, the son-giver, boon-giver, desire-fulfiller, and wealth-giver of the chaste (Sati') mother of Vedisiri (Vedishri) and Sirimitra (Shrimitra), the illustrious (queen) excellent, conferring greatness and blessings, fasting for a month, performing austerities without being a recluse, observing a curb over the senses (*charita brahma chariyaya*), clever in initiation (*diksha*), vows (*vrata*) and sacrifices, fragrant with the offerings given in sacrifices, constant performed sacrifices.

Description: At the Aga'dheya (Sk. Agnya'dheya) sacrifice, gave a gift of twelve cows and one horse; at the Ana'rabhaniya (Sk. Anva'rambhaniya) sacrifice, a gift of eight cows (performed the Va'japeya sacrifice), gave gifts of 1700 cows and 17 elephants seventeen into seventeen, 289 of Sadabi (P), 17 silver jars, at the (Ashvamedha) sacrifice with great preparations and pomp, gave gifts: 10,000 cows, 1000 cows, (ka'rsha'pana coins) in gifts to learned Brahman visitors 12, a good village, 24,400 ka'rsha'panas (as a regular sacrificial) gift and 6000 ka'rsha'panas to learned Brahman visitors, (performed the) Ra'ja (suya sacrifice, gave gifts) 1700; 1 yoked cart full of grain, 1 good robe, 1 horse, 1 horse chariot, 100 bullocks; performed a second Ashvamedha sacrifice and gave the (following) gifts: 1 horse with silver ornaments, 12 gold bracelets, gave in gift 24,000 ka'rsha'panas, a village, elephant, (gave in gifts) 60,000 cows, a yoked cart full of grain, (performed) *vaja* sacrifice, gave in gift cows 17 cows with calf of the va'ja sacrifice 17 she-goats, (gold bracelet) gave in gift to. learned Brahman visitors (20,000 ka'rsha'panas) gave (in gift) cows sini (?) 12, 1 horse with silver ornaments, gift of 10,000 ka'rsha'panas, (gift) cows 20,000; performed Gobhiladashara'tra sacrifice, gave in gift cows 10,001, performed Gargatrira'tra sacrifice, gift cows, gave to learned Brahman visitors 301 robes, performed the Gava'mayana sacrifice, gave in gift 1101 cows, gave in gift 1101 cows, to learned Brahman visitors 200 ka'rsha'panas, 100 robes; performed the A'ptorya'ma sacrifice, gave in gift Performed the Gava'mayana sacrifice, gave in gift cows 1101. Performed the sacrifice, gave in gift 1101 cows Performed the Shata'tira'tra sacrifice, gave in gift 1101 cows Performed the sacrifice, gave in gift 1100 cows. Performed the A'ngirasatrira'tra sacrifice, gift cows Performed the Vaidatrira'tra sacrifice, gift cows 1002. The Chhandomapavama'na sacrifice, gift cows 1001. Performed the Antarvasutrira'tra sacrifice, gave in gift 1001 cows. Performed the Para'katrira'tra sacrifice, gave in gift cows 1001. Performed the Para'kachhandomatrira'tra sacrifice, gave in gift cows Performed the Jamadana sacrifice, gave in gift 1001 cows gave in gift 1001 cows Performed the satra sacrifice, gave in gift 1001 cows. Performed the Gava'mayanaohhavasa gave in gift 1000 cows Performed

the sacrifice, gave in gift 1001 cows Trayodasha (ra'tra)
 Tra'yodashara'tra with Varsha'ra'tra, gave in gift cows Dasharatra
 gave in gift 1001 cows sacrifice, gift gave gift.

In the back a niche or recess, about nine inches deep, began about 1' 8" from the east wall and continued to within 5' 7" of the vest wall. In this long recess there are traces of eight figures or statues about life-size. Almost nothing is left in the wall to show where the statues stood except the feet, and in several cases the feet are worn to a rounded knob. But near the top of the wall, above each, the name of the person represented is carved in large letters. The first figure is king Satavahana, whose feet and the end of a waistcloth falling between the feet, remain about 1' 5" from the east wall. The next figures were a couple of statues of queen Nayanika and king Satakarni. Almost no trace of this couple is left, but a slight swelling which was once one or two pairs of feet 1' 6" and 2' 11" from the feet of king S'atakarni. The fourth figure, whose feet can be dimly traced about 1' 10" from number three was ' Prince Bhaya.' Two feet one inch to the right are a pair of feet, whose is not known, as the inscription is broken. The sixth, which is 2' 5" from the fifth, was the statue of Vir or Yar the champion and saviour of the Marathas. The seventh, of which the only trace is a rounded knob representing feet about 2' 4" from Yir, was prince Hakusri. The eighth which is 2' 5" further was prince Satavahana. About 18" beyond S'atavahana, the recess ends and the whole of the wall is covered with writing. To the left or south of the rest-cave is a cistern 5' 5" broad and about 7' long, half of it passing under the hill side. Close by is a second cistern 5' X 4' and a third 5' X 7', and a little further on are three more, 3' 4"x3', 3' 6"x2' 7", and 3' 4"x3'. Above the cisterns is a view-seat, 18'4" x 11'9", and a small seat 3' 6"x 2' 4" inside. On the right side of the path, opposite the inscription cave, an unfinished cave 24' 6" x 9' 4" and 7' high, has a recess about 4' 2" in the back wall. A few paces beyond an opening with mud and water is about 9'x 11' 10" and 5' 1' high. Further on, at the same level, are several more cuttings, but, from the force of the south-west monsoon, their front walls have fallen away and they now differ little from natural caverns. Down the hill face the path zigzags sharply between two great walls of rock. It is paved with irregular slippery stones with, at intervals, traces of old dressed stones or worn rock-cut steps. On both sides, every now and again, are small plain cisterns, one on the left with traces of an inscription and another on the right about half a mile from the main cave and nearly at the foot of the crag with an inscription. [See below p. 223.] For half a mile further the path continues to zigzag sharply down a very steep slope at the foot of the scarp till it reaches the under slopes which are thickly wooded. From the beginning of the woods, and still better, from the Shingaru or Foal about a mile further, is a splendid view of the great tower like overhanging crag of Nana's Thumb.

The following account of the Nana pass from the Konkan side is repeated from the Statistical Account of Thana. [Bombay Gazetteer, XIV. 286-291] Nanaghat or Nana's pass in Murbad about seventy miles north-east of Bombay and about forty miles east of Kalyan station on the Peninsula railway, is a frequented pass in the Sahyadri hills with interesting remains and inscriptions which date from before the Christian era. Though steep and hard to climb, the Nana pass is the natural outlet for the great commerce which, in early times, centred in Junnar about twenty miles to the south-east and in Paithan

about- a hundred miles to the east and in later times (A.D. 1490 - 1630) in Ahmadnagar about halfway between Paithan and Junnar. In 1675 Dr. Fryer, who had been, misguided by the Avapa pass on his way up, came back from Junnar by what he calls the ' Nanny Gaut,' and explains to mean ' the little hill, in respect of the other which mounted a prodigious height above it.' At the top of the pass Fryer was stopped by a drove of 300 oxen laden with salt. After an hour's standing in the sun he got the drivers below to wait, and then the path was easy ' being supplied at fit distances with charitable cisterns of good water, and, towards the bottom, adorned with beautiful woods.' [East India and Persia, 141.]

At the beginning of British rule (1818) the Nana pass was in fair order, with a paved way which was supposed to have been made by Nana Fadnavis (1764-1800). In 1819 it was among the passes which, in the Collector's opinion, deserved to be kept in repair. [Mr. Marriott to Government, 29th Sep. 1819, Revenue Diary 144 of 1819.] Though the opening, first of high roads (1830-1840) and afterwards of railways (1858-1865), has drawn to the Thal pass in the north, and to the Bor pass in the south, the bulk of the trade between the Deccan and the coast, a considerable passenger and grain and salt traffic still centres in the Nana" pass[Cocoanuts, rice, salt, sugar and sugar candy go to the Deccan, and myrobalans, chillies, cotton seed, cotton, vegetables, pepper, and wheat come to the Konkan, See above p. 144.] which, however, is not passable for carts.

At the foot of the pass, which is about twenty miles east of Murbad, is the village of Vaisagra, *vaishya griha*, the merchants' or husband-men's dwelling place, with a small river called the Kanikhara or the gold-bearer, whose source is said to be in three springs which rise in the hills on either side of the pass. A little to the as of Vaisagra is its suburb Pardhanpada or the minister's village. From here the ascent begins with a gentle rise, and passes up, through thick forest, about a mile and a half, to a tableland called Shingaru or the Foal, where, near two pools of water (one of them roughly built), travellers and loaded animals rest. At Shingaru a road branches to the left to Pulu Sonala. This, of which an account is given later on, was once the favourite route but is now seldom used. From Shingaru is a rise of about a mile and a half. Over the tableland hangs the great wall of the Sahyadris, from whose level top shoots forth the bare thumb-like pinnacle of rock locally known as *Nanacha Angtha* or Nana's Thumb. The west or Konkan face of the thumb is a sheer cliff but the east or Deccan face falls with a gradual slope. The valley to the left or south of the thumb is called Guna; the valley to the right or north is called Nana, the people say that Nana and Guna were two brothers, who were asked by a king of Junnar to make a road from the Konkan to his capital. At the brothers' request it was agreed that the pass which was first finished should be used and be called by the name of the brother who made it. Both began work on the Konkan side, each up one of the valleys that flank the thumb. Guna's path had. an easy slope, but, at the end of the year, it was little more than begun; Nana's was a steep rough track, but it was finished, and, as he had promised, the king was satisfied and called it by Nana's name. The Nana pass is the one ordinarily used, for the Guna pass, though at first easier than the Nana pass, is afterwards very steep and difficult.

The Nana track climbs a steep slope in zigzags of undressed stone which seem to have once been rock-cut steps, of which broken or worn traces remain. On either side of the path the hills rise thickly covered with trees, and, at intervals, seats and cisterns or reservoirs are cut in the rock. About a mile above Shingaru, on the left, near a *vavla* or *Ulmus integrifolia* tree, is a two-mouthed cistern much like the cistern marked No. 5 at the Kanheri caves. It is very deep, but is dry and choked with rubbish. In front of the recess is an inscription, which, in letters of the first or second century after Christ, records that the cistern was cut by a merchant named Damaghosh of Kamavan in the thirteenth year of Chaturparna S'atakarni son of Vasishthi. A little further to the left is a reservoir with clear limpid water, and near it a rest-seat cut in the rock with an inscription of one line, stating, in letters of about the first or second century after Christ, that the seat was cut by one Govindadas of Sopara. A little further on the right are several small cisterns without writing and of no special interest. Further on, a little below the crest of the pass, is a cistern filled with mud, and in the recess above it are traces of letters enough to show that there was an inscription. Beyond this, to the right, are other smaller cisterns.

The old road from the Konkan to the Shingaru plateau came from the south by the village of Pulu Sonala. This path is now little used except by persons going to Pulu Sonala. Along it are some rock-cut cisterns, and at the beginning of the ascent, at a place called Ganesh thal or Ganesh's Plateau, is a stone box of the same size as the jar at the crest of the Nana pass, but square instead of round. The fact that it also is called *jakaticha ranjan* or the toll-jar supports the theory that both were used for collecting money. Near the jar are some ruins probably of a rest or toll-house. A little further, to the south, is Pulu Sonala village with Brahmanical-looking caves in the hill slopes four miles to the east. The way to the caves is very difficult, and, except one large chamber, there is nothing of sufficient interest to repay the trouble of the climb. It is not easy to say to what sect the caves belonged. A sculptured image of the goddess Mahishamardini or the Buffalo-slaying Devi, set as an ornament on a pillar in the large chamber, proves that the sculptors were neither Buddhists nor Vaishnavs. In a recess in the back of the chamber, near where, in other caves, the object of worship is generally placed, is a cellar much like a cistern. But this is not the proper place for a cistern, nor has it any water channel to feed it. Cellars like this were chiefly used as places of meditation by followers of the Yoga system, and it is probable that the ascetic for whom this cave was made belonged to the Yoga sect. There is no inscription in the cave, but the form of the pillars seems older than the eighth century.

Whatever be the origin of the story of the brothers Nana and Guna, it is curious to find the name Nanaguna in Ptolemy. Ptolemy mentions Nanaguna thrice, each time as the name of a river. In one passage the sources of the Naguna or Nanaguna, are said to be from mount Auindu, where the hill is cleft towards the Gaoris and the Binda.[Bertius' Ptolemy, 204. The Gaoris is probably the Vaitarna, so called from the town of Goreh in Vada, and the Binda the Bhayndar or Bassein creek.] The second passage runs 'About the Nanaguna are the Phyllitee and the Bitti,' [Bertius' Ptolemy, 204] and the third is 'The mouth of the Nanaguna river.' In Ptolemy's list of names "on the Konkan coast, [Bertius' Ptolemy, 198,] the mouth of the Nanaguna river comes far south in Pirate-Ariake, that is in Ratnagiri. The source of the Nanaguna is also carried far east, half

across the continent to the Vindhya mountains. At the same time, not far from the, west coast, south of Nasik and east of Sopara, close to the actual position of the Nanaghat, the lines of the Nanaguna, the Binda or Bassein creek, and the Gaoris river or Vaitarna, are made to join. This, and the phrase 'Where the hill is cleft towards the Gaoris and Binda rivers,' suggest that Ptolemy may have been told that the great stream of trade, from the coast to the inland marts of Paithan and Tagar, flowed along three lines, which centered in Nanaguna where the hill was cleft. And that from this Ptolemy thought that Nanaguna was a river, the same river on which Paithan was built.

For 1500 years after Ptolemy no reference to the Nanaghat has been traced. In 1673 Fryer referred to it and to its cisterns. IN 1828 Colonel Sykes noticed its excavations and cisterns, and gave a rough copy of its inscriptions. In 1838 Prinsep tried to decipher Colonel Sykes' copy of the large inscription in the chamber. In 1854 Dr. Stevenson noticed the large inscription, and made observations on some words from it. In 1876 Pandit Bhagvanlal wrote a paper on ancient Nagari numeration from the numerals in the large inscription, and in another paper, in 1877, he translated the inscriptions above the figures in the recess in the back wall of the large chamber.

History.

Strongly placed in a rich country on the Nana pass route, with a good climate and facilities for trade, Junnar appears to be a very early settlement. The hundred and thirty-five caves in the three hills which enclose it with their thirty-five inscriptions show that Junnar was a great Buddhist centre and had easy communication with Kalyan in Thana, apparently by the Nana pass, and with Broach in Gujarat. One of the inscriptions records a gift by a minister of the Paithan Kshatrapa Nahapana (A.D.10?) from which Professor Bhandarkar believes that Junnar may have been the capital of Nahapdna. [Bhandarkar's Early Deccan History, 22. Pandit Bhagvanlal (Jour. Bom. Brt Roy. As. Soc. XIII. 17) identifies Junnar with the Tagar of the Egyptian geographer Ptolemy (A.D.150) and the Greek author of the Periplus (A.D. 247). But for reasons given above, Part II. p. 211, the identification does not seem likely.] Nothing is known of Junnar till the eleventh twelfth and thirteenth centuries to which period belong the Hemadpanti temples and wells whose remains are found in and near the city. [See above p. 148. To about this time belong the Jain additions in the Manmoda caves. See above p. 170.] About this time, as the style of the reservoirs on its top and the defaced rock-cut figures of Hanuman and Ganesh at the beginning of its rock-cut stairs on the Junnar face show, Shivner fort appears to have been held by the Yadavs of Devgiri or Daulatabad (1170-1318).[See above p. 189. Compare Briggs' Ferishta, II. 436.] In 1443 the leading Bahmani noble Malik-ul-Tujar secured Shivner fort and sent several detachments from Junnar into the Konkan. [Briggs' Ferishta, 11.436.] Junnar was also at this time the head-quarters of the Koli head captain or *sarnaik*, appointed by the Bahmanis to control the Kolis and other wild tribes of the Sahyadri Mavals.[Jour. Bom. Geo. Soc. I. 238.] About 1470 the Russian traveler Athanasius Nikitin came from Cheul to Junnar in twenty-four days by what appears to have been the Pimpri pass. [See below Navlakh Umbre.] The town stood on a stony island, no human hands built it; God made the town; a narrow road which it took a day to climb, broad enough for only one man at a time, led up the hill. At Junnar lived Asat

Khan a tributary of Malik Tuchar, that is Malik-ul-Tujar, the governor of Daulatabad. Asat Khan held seven of Malik-ul-Tujar's twenty-seven *tmās* that is *thanas* or posts. Nikitin wintered, that is passed the rains, at Junnar living there for two months. For four months day and night there was nothing but rain and dirt. [Major's India in XV. Century; Nikitin, 9. Nikitin's details of the state of the country and the people are given in Part II. pp. 218-219.] About 1485 Malik Ahmad, the founder of the Nizam Shahi dynasty (1490 - 1636), was appointed manager of Nizam-ul-Mulk's new estates in the North Deccan and made-Junнар his head-quarters. The Maratha commandant of Shivner refused to give up the fort on the plea that the king was a boy and that changes of estates and forts should not be made till he came of age. Malik Ahmad attacked the fort, and after a long siege the garrison surrendered with their swords round their necks and dressed in shrouds. The capture of Shivner was of the greatest importance to Malik Ahmad as five years' revenue of Maharashtra was stored in the fort. The treasure enabled Ahmad to make rich presents to his officers and troops and helped him to secure all the places of strength in west and south-west Poona.[Briggs' Ferishta, 191, 196.] On his father's assassination in 1486 Malik Ahmad, who was besieging Rajpuri in Janjira, returned to Junnar, assumed the title of Nizam-ul-Mulk Bhairi, and set himself to improve the country. As Malik Ahmad had practically thrown off his allegiance, Mahmud Shah Bahmani II. (1482-1518) ordered Yusuf Adil Khan of Bijapur and the commandant of Chakan, about thirty miles south-east of Junnar, to attack him. Ahmad tried but failed to win to his side the Chakan commandant. As the Bahmani army was advancing against him, Ahmad left his family in Shivner and marched to meet the Bahmani force. He took Chakan, and from Chakan he marched against and defeated the Bahmani army. He returned to Junnar and busied himself with improving the; internal management of his territory. [Briggs' Ferishta, III. 195.] In 1493 Ahmad's sister, the wife of the commandant of Daulatabad, came to Junnar complaining of the murder of her husband and son. Malik besieged Daulatabad for two months without success and returned to Junnar. [Briggs' Ferishta, III. 200.] In 1494 Ahmad moved his capital from Junnar to his newly founded city of Ahmadnagar. [Briggs' Ferishta, III. 202.] In 1529 Burhan Nizam, the second Nizam Shahi king (1508-1553), sustained a defeat from the troops of Bahadur Shah of Gujarat (1525 - 1535) and retired to Junnar [Briggs' Ferishta, II. 353.] In 1562 Husain Nizam Shah the third Ahmadnagar king (1552-1565), pursued by Ram Raja of Vijaynagar (1541 -1565) and Ali Adil Shah of Bijapur (1557 - 1580) retired to the Junnar hills and employed his troops to lay waste the districts of Junnar and Purandhar. [Lassen, IV. 214.] In 1564 on the accession of Murtaza Nizam Shah, the fourth Ahmadnagar king, his second brother Shah Kasim was placed in confinement at Shivner fort. [Briggs' Ferishta, III. 271.] In 1595 king Bahadur Nizam II. (1595 -1605) ennobled a Maratha named Maloji Bhonsla the grandfather of Shivaji, enriched him with the estates *or jagirs* of Poona and Supa and the charge of the forts and districts of Shivner and Chakan. [See Part II. p. 222.] In 1605, with the decline of Moghal power in the Deccan, Malik Ambar raised Murtaza Nizam II (1605- 1631) to the throne, succeeded in recovering Junnar, and made it the head-quarters of a state, which included the greater part of the former possessions of Ahmadnagar. [Grant Duffs Marathas, 43.]. In one of her flights Shivaji's mother Jijibai came to Junnar on the 17th of May 1626 [Walks' South of India, I. 71.] and in 1627, in Shivner fort, Jijibai gave birth to Shivaji the founder of the Maratha empire. [Grant Duff's Marathas, 55.] In 1637 as Shahaji declined to enter Bijapur service and give up Junnar and other fortresses to the

Moghals, Mahmud of Bijapur (1626- 1656) helped the Moghal general Randulla Khan to overcome Shahaji who eventually agreed to enter Bijapur service and give up Junnar and other Poona forts. [Grant Duff's Marathas, 53; Elliot and Dowson, VII. 60.] About 1650 the Kolis of north-west Poona rose in rebellion. A Moghal army was sent into the hills, the hill forts were strengthened and garrisoned, the Kolis were hunted down and either made prisoners or slaughtered. The prisoners were taken to Junnar and their heads cut off and piled in a pyramid and a platform built over them which is still known as the Black Platform or *Kala Chauthra*. [Captain Mackintosh in Trans. Bom, Geo. Soc. I. 241-242.] In May 1657 Shivaji surprised and plundered Junnar in a night attack and carried off about £110,000 (3 *lakhs* of *pagodas*) in cash, 200 horses, valuable cloth, and other articles.[Grant Duffs Marathas, 73.] In 1663, after Shaiste Khan's surprise in Poona city, strong detachments were left at Chakan and Junnar and the main body of the Moghal army retired to Aurangabad. [Grant Duff's Marathas, 88,89.] In 1670 *Fryer 1673*. Shivaji made an unsuccessful attempt on Shivner. [Grant Duff's Marathas, 110.] In 1675 Shivaji made another unsuccessful attempt on Shivner his birthplace which was never destined to fall into his hands. [Grant Duff's Marathas, 119. Orme (Historical Fragments, 47), mentions that Shivaji sent two of his men to surprise Shivner. They got to the top but were discovered and the usual defence of rolling down stones piled from the top dispersed the assailants.] About, this time the services of the English physician and traveller Fryer were sought by the Moghal governor of Junnar or, as he calls it, Jeneah. Fryer started from Bombay on St. George's Day, the 23rd of April 1673, and reached Junnar on the 30th of April having passed by Kalyan Murbad and the steep Avapa pass. On the first of May 1673 Fryer waited on the governor of Junnar city in his castle, that is in the city fort or *kot* where the mamlatdar's office now is. It was large but made with a wall of raw brick serving to secure cattle as well as men.[Briggs' Ferishta, III. 195.] The governor's mansion was in the middle of the enclosure surrounded by a green quadrangle of trees and plants. In the chief hall or country was the governor with his great men on his right. The governor sat bolstered with embroidered cushions smoking a hubble-bubble, with a rich sword and buckler laid in front of him, and a page holding a bow and arrows in the Turkish fashion. The floor was spread with a soft bed with a fine sheet drawn over it. Fryer took off his shoes and was seated on the governor's left. Fryer had been asked to Junnar by the governor to see one of his wives who was sick. On the first lucky day after his arrival he was sent for to the ladies' quarters which were opposite to the governor's reception room, and in which lived four wives and more than 300 concubines. An old gentlewoman, with a tiffany veil, the government of the women's quarters, made many trips back and forward, and at last Fryer and his linguist were allowed in. The old lady clapped her hands and led him through a long dark passage with rooms on either side. In an airy room was a bed which was completely surrounded by silk curtains. Fryer was told to put his hand through the curtains and feel the patient's pulse. Fryer found the hand sound and free from disease and told them the patient was well. They were pleased as they had put a healthy slave in the bed to try Fryer's skill. He then felt the wife's hand languid and weak and passed sentence. The ladies were much pleased with his skill and next day he was called in to bleed another of the wives. A curtain was drawn across the room and an arm held forth at a hole. But there were many of the women behind the curtain and as they pressed forward to have a peep at the doctor, the curtain gave way and the whole bevy fluttered like so many birds when a net is cast over them. Still none of

them sought to escape, but, feigning a shamefacedness, kept on looking through the wide lattice of their fingers. The lady Fryer had by the arm was a plump russet dame, and after the bleeding was over summoned the rest of her blood into her cheeks and ordered the curtain to be again hung up. She poured a golden shower of pagodas on the blood which Fryer made his man fish for. The ladies were clothed like men; in-doors they went in their hair, that is bareheaded, and abroad with veils. Like the Gypsy or Egyptian Cleopatra of old they exercised their ears and noses with weighty jewels. They seemed to lead a pleasant life. They had singing wenches to amuse them and were not unemployed, peeling mangoes and other fruits, making pickles, and doing fine samples of needle work. [East India and Persia, 132-133.] Fryer found Shivner or Jeneahgad the only fort left to the Moghals. There was as commandant of the fort, a Brahman, who had turned Musalman, who never went further than the foot of the hill and a governor of the town and district with a nominal force of 17,000 horse and 3000 foot, but an effective strength of not more than half that number. Most of the horse were Moghals and most of the foot were Gentoos. The governor lived in the fortified garden in which the mamlatdar's and other Government offices are now placed. There was no security in Junnar. The walls of the town were broken down though the gates remained. Trade had fled, though the city was well placed for coarse chintz and fine lawn, and had plenty of cotton ground and good wheat land but the fields were no sooner sown than they were burnt by the Marathas. The ploughmen and weavers had fled like the traders. Not one rich landholder was to be heard of within seven or eight days' journey. Provisions were the only things offered for sale and these the military forced the country people to bring in. Even the strong body of troops could not hold their own with the Marathas. The Moghals at Junnar seemed encamped rather than fortified. If Shivaji came in force they fled to the main army which was stationed three days off all Pedgaon in Ahmadnagar. [This is Pedgaon about forty miles south of Ahmadnagar which from 1672 to about 1710 was one of the principal stations of the Moghal army. Compare Ahmadnagar Statistical Account, Bombay Gazetteer, XVII. 700, 733.] Shivaji was very anxious to take Shivaner not only because of its strength and importance but because it was his birthplace. An attempt had lately been made and was nearly successful.

In May (1673) Fryer paid a visit to the invincible *Gur of Jeneah* or Junnar that is Shivner fort. The governor of the hill asked Fryer to visit him either on the hill top or in his garden below, which was the prescribed limit of his walk. Fryer said he would visit him on the hill top, and the governor's brother and an ingenuous Moghal with four palanquins were sent to escort him. They travelled two miles to the foot of the hill where was a garrison or fortified town, walled with strong watches, a troop of 500 horse and 500 camels, and huge stacks of hay and corn, for their droves of beasts were sheltered here at night. Shivaji had often distressed this town and put them to rout. The fort on the hill top was safe. No one could reach it except by seven winding gates which, were, very strong and able to clear one another as they rose, and the way lined with murderers and defended with good pieces of ordnance. The path was composed of slippery marble steps, cut out of the shining rock, as smooth as glass and reflecting the sun as brightly as glass. Riding was painful and keeping state in a palanquin required a strong back as the palanquin was carried bolt upright. After he had mounted near a hundred steps Fryer was received into the neck of the castle which was collared with a wall and furnished with a

gate of excellent work and strength filled with soldiers. From the neck of the castle an easy ascent led to a level circus where the infantry were trained. Here were conspicuous and finely built tombs of former kings and a mosque of polished marble where the garrison went on festivals. [It seems from this that the buildings in the south-west corner of the hill are Maratha,] As no houses were able to stand the heat and the storms of the hill top, the eastern side of the hill was most inhabited as the central hill top sheltered it like a bank. They lived in little low huts, the governor in a pretty neat dwelling fenced with trees, the only trees on the hill top. The governor, who was a Brahman who had turned Musalman, was a lover of Franks and was most friendly to Fryer. He let him go all round the castle. Fryer was shown a place which Shivaji's men had lately tried to scale. The garrison had fled hearing that Shivaji was coming with a great army and only the governor and some women were left. Two of the men managed to reach the hill top, but a stone falling by chance kept back the rest and the governor and the women hurled the two men down the mountain. The hill top had seven years' provisions for a thousand families. It was full of granaries hewn out of stone, Fryer supposed at first for religion's sake as they were too delicately engraved for their present use. There were several cisterns filled with butter 400 years old, a black stinking and viscous balsam, which the gentiles prized as high as gold for aches and sore-eyes. The water cisterns looked nastily green yellow and red. There was no ammunition but stones. The only pieces of ordnance were, at the two ends of the hill, a narrow bored brass *jaker* twenty-two feet long unshapen and of Gentoo mould, on a huge winding carriage. One of these guns about four months before fired at random into Shivaji's camp and killed a Raja about three miles off. No horse or elephant could climb to the hill top. The garrison was 1000 swordsmen and the chief gunner was a Portuguese half-caste. On the top of the hill in a wretched dwelling was a Dutch apostate enjoying a pair of wives the miserable tools who had brought him to this lamentable condition. He was despised and slighted by all, the usual fate of Christians who endure circumcision. The governor received Fryer in a chamber in his house which was hung with checkered green and red velvet. He was affable in manner and surrounded by a grave retinue. His name was Hagress Caun, or Hafiz Khan, originally a Brahman now a strict Musalman. He had been governor of Junnar city but oppressed the people being of covetous humour. He had a liberal pension and no expenses. Shivaji had lately tried to get him to betray his trust. Hagress Caun took mountains of gold and sent word to Bahadur Khan that Shivaji was going to attempt to take Shivner and the besieging force was caught in ambuscade and put to flight. At parting he gave Fryer a Kashmir bow-ring a charm against thunder. Fryer was well entertained by Nizam Beg, a relation of the governor's, poor but of a generous open temper but neither jealous nor lazy as most Moors are. He was a good Persian and Arabic scholar, and skilled in handicrafts which he had been taught by Europeans. He was a great lover of Franks or Europeans. He received Fryer in an airy banqueting room, amused him with dance- and with a jester or mimick, and with his own hand served him with slews and baked meats. [East India and Persia, 136.138.]

Fryer noticed on the top of Shivner hill many places cut in the rock then used as granaries, but in his opinion owing their origin to religion as they were too finely engraved for their present work. On his way down he saw many dens and caverns fondly believed to be carved and cut out of the rock by some divine power having no account of

their original. Fryer thought them indeed miraculous, the work of the pious zeal of former ages in undisturbed tranquillity, thinking the greatest labour too little to express their love to a deity. The passages to the caves were difficult and they wore unprovided with human necessities. [East India and Persia, 137.138.]

Fryer set apart a day to take notice of the adjacent rarities. The chief of these was a city called Dungeness, that is Ganesh Dongar, as old and as fine work as the Kanheri caves in Salsette, cut out of a mountain rock with a temple and other spacious halls, Both for water and for other refreshments it was in no way inferior to Kanheri and it was much more entire. Time had not dealt so cruelly with it; the lines of its ruined beauty might still be read though in old characters. Still it was desolate; a home for bats and' for wasps, to disturb which was dangerous, being overgrown and desperately revengeful. [East India and Persia, 134.135.]

Fryer notices that the Moghals are inclinable to the like credulity with the Gentoos. They point out a mount where undoubtedly Solomon gave audit to the two women who claimed the same child. It bears the name of Tocta Scheilmun that is Takhta Sulimani, Solomon's Throne. [East India and Persia, 139.]

Fryer went to see a ruined palace where Aurangzeb, the presed emperor, was hospitably received in his father's reign and lived a pretended *fakir*. [East India and Persia, 134.] He also mentions a garden left by a common strumpet with a noble tomb built in remembrance of her with a well belonging to a lovely spring which by aqueducts supplied the city with water.[East India and Persia, 134]

In 1684 Aurangzeb ordered *thanas* or posts to be placed in the country between Junnar and Sinhgad. In 1705 Aurangzeb halted 7½ months near Junnar before he marched towards Bijapur. [Grant Duff's Marathas, 178; Elliot and Dowson, VII. 379.] In 1716 Shahu demanded Shivner fort from the Moghals. [Grant Duff's Marathas, 197.] In 1762 Shivner was among the territory which Raghunathrav offered to the Moghal army which defeated Madhavrav, the fourth Peshwa (1761 - 1772) midway between Poona and Ahmadnagar. [Grant Duff's Marathas, 326.] In 1777 Balvantrav Bede, the brother-in-law of Nana Fadnavis, treacherously seized and killed five outlaws at Junnar. Balvantrav was haunted by the ghosts of the murdered men and, to regain his tranquillity, he built a temple near Junnar, and in it, as the object of worship, set five stones or *panch lings* representing the five Kolis he had executed. [Trans. Bom. Geog. Soc. I. 256.] In a revenue statement of about 1790 Juner is mentioned as the head of a *sarkar* of twenty-three *pargands* with a total revenue of £146,434 (Rs. 14,64,338) and a sub-divisional revenue of £38,342 (Rs. 3,83,420). The limits of the Junnar *sarkar* apparently extended from Parner in Ahmadnagar to Sasvad in Poona. [Waring's Marathas, 240.] In 1793 Nana Fadnavis removed Bajirav and Chimnaji Appa, the two sons of Raghunathrav, from confinement at Kopargaon and Nasik to Junnar where, according to the local story, they were kept in close custody in the *gadhi* now used for the subdivision revenue and police offices. [Grant Duff's Marathas, 520. See above p. 147.] On Peshwa Madhavrav II.'s death in 1795 Parshuram Bhau went to Junnar and offered the Peshwaship to Bajirav. Parshuram Bhau held a cow by the tail and swore by the Godavari, and Bajirav was

satisfied and went with him to Poona. [See Part II. p. 272.] In June 1814 Mr. Elphinstone visited the 'town and rich valley of Joonere, with the scarped fort of Sheonaree over the town.' He went up the Ganesh Lena hill and saw the caves. [Colebrooke's Elphinstone, I. 281.] In November 1817 Bajirav Peshwa, flying from Manuli in Satara and Pandharpur in Sholapur, came to Junnar among whose hills he hoped Trimbakji Denglia would make him safe. At the end of December, finding no safety in Junnar, Bajirav fled south to Poona. [Grant Duff's Marathas, 655.] In the war which followed with the Peshwa a detachment under Major Eldridge came to Junnar on the 20th of May 1818. Both the mud forts of Junnar and Shivner were deserted and taken possession of by Lieutenant White of the 1st Auxiliary Battalion on the night of the 21st. Annabhai Rattikar, the commandant of Shivner, had fled to Hadsar fort, ten miles west of Junnar, where he was taken. [Pendhari and Maratha War Papers, 293-294.] A battalion of Bombay Native Infantry, two six-pounders, and a party of Captain Swanston's Horse were kept at Junnar. [Blacker's Maratha War, 315.] In 1827 Captain Clunes notices Junnar as a sub-divisional head-quarters with 3000 houses. [Itinerary, 16.] In 1828 Junnar had some fruit gardens, a good local market, and a population of not over 8000. [Mr. Pringle, 6th September 1828, in Lithographed Papers.] In 1841 Dr. Gibson, Conservator of Forests, believing that Shivner would be a hot weather health-resort, as it was then intended to have a central Sahyadri railway along the Malsej pass, with the help of four Chinese convicts planted a nursery of 200 exotic trees on the top of Shivner fort. [Poona Collector's 9220 of 21st December 1883. See Part II. p. 76. The olive still flourishes on the hill. See above p. 158.] In the 1845 disturbances of Raghoji Bhangria a detachment of Native Infantry was quartered at Junnar. [See Part II. p. 308.]

KADUS.

Kadus, on the Kamandalu a feeder of the Bhima, six miles north-west of Khed, is a large alienated village, with in 1872 a population of 3437 and in 1881 of 3571. A weekly market is held on Wednesday. To the west of the town on the left bank of the Kamandalu are small shrines of Mahadev, and near the shrines is a rude and massive temple of Bhairav called Siddheshvar. A fair attended by 1000 people is held at the temple on the tenth of the bright half of *Chaitra* or March-April.

KALAMB.

Kalamb, is a small village on the Poona-Jurmar rond about thirteen miles south-east of Khed and four miles north of Mam-bar. In 1814, according to Sir T. E. Colebrooke, Mr. Elphinstone noted caves in the hills round 'Kullum' many of them difficult of access and some with inscriptions. [Colebrooke's Elphinstone, I. 283.] He describes them as very handsome. A careful search in the hills round Kalamb shows no trace of caves and the people of Kalamb know nothing of carves. Apparently a mistake has been made in extracting from Mr. Elphinstone's diary. It is difficult to say whether the caves visited by Mr. Elphinstone were the Manmoda group to the south-east of Junnar with forty-five caves, and nineteen inscriptions or the Shelarvadi group with six caves and one inscription.

KALAS.

Kalas, village, fifteen miles north-west of Indapur, with in 1881 a population of 1066, has a weekly market on Tuesday.,

KARDE.

Karde, a market town of 2074 people, stands in a plain among small hills, six miles south of Sirur. Karde is a large trade centre with about 190 merchants shopkeepers and moneylenders, The trade is chiefly in grain and other articles from the neighbouring villages or from the Bala Ghat in the north-east. The grain is sent to Poona, Junnar, and other market towns. Karde is the largest cattle and money centre in the Sirur sub-division and is much frequented by distant traders.

KARLE.

Ka'rle in Maval, six miles west of Khadkala, is a small village of 731 people with a station on the Peninsula railway and a public works bungalow. A weekly market is held on Friday. About two miles north of Karle, within the limits of Vehargaon village, is a noted group of Buddhist caves details of which are given below under Vehargaon.

In 1817 Karle was the scene of the capture of the Vaughan brothers who were hanged at Talegaon. [See below Talegaon Dabhade.] In 1827 Captain Clunes notices Karle with forty-two houses eight shops and a tank. [Itinerary, 10.]

KAVTE.

Kavte, a large village, twelve miles north-west of Sirur, with in 1881 a population of 2063, has a weekly market on Thursday.

KENDUR.

Kendur, on the Vel a feeder of the Bhima, about twenty miles south-west of Sirur, is a large market town, with in 1881 a population of 2989. The weekly market is held on Monday. The second Peshwa Bajirav Balaji (1721-1740) granted Kendur to his favourite mistress Mastani. [Details of Mastanbai, better known as Mastani, are given below under Pabal and Poona objects.] To the east of the town is the tomb of a Musalman saint Wali-Bawa where a small fair or *urus*, attended by 500 people, is held on the bright fourth of (*Chaitra* or March-April. The tomb enjoys a grant of land assessed at 4s. 6b. (Rs.2¼.)

KHADKALA.

Khadkala, on the right bank of the Indrayani thirty miles north-west of Poona, is the head-quarters of the Maval sub-division with a railway station and in 1881 a population of 816. Though a small village Khadkala, on account of its central position and the vaearness of the railway, has been made the head-quarters of a subdivision. Not far from

the railway station is a rest-house for native travellers. The 1880 railway returns showed 26,921 passengers and 739 tons of goods.

KHANDALA.

Description.

Khandala, north latitude 18° 46' and east longitude 76° 23', in a hollow about 1787 feet above the sea and 200 below the crest of the Sahyadri hills, forty-two miles north-west of Poona, is a station on the Peninsula railway, with in 1881 a population of 3069. The Khandala hollow highlands to the east south and west, slope north-west to the wild gorges of the Paraha and Ulhas rivers. To the north is the wild gorge of the Ulhas, to the east rows of low ridges that, running nearly north and south, part the Ulhas and the Indrayani, to the south the Bhoma-Umbhari hills, and to the west a long flat spur that stretches north into the Ulhas ravine. Besides by the slopes that lead to the Bhoma-Umbhari hills and to the western spur, the level of the Khandala hollow is broken by several knolls crowned by casuarinas, mangoes, bamboos, *jambhuls*, and other forest trees; it is seamed by the beds of torrents that cut their way north from the steep sides of the Bhoma range to the Ulhas ravine; and it is crossed from north to south by the Peninsula railway and from southeast to north-west by the Bombay-Poona high road. Houses are dotted over almost the whole of the Khandala hollow. European and Parsi dwellings hold most of the higher sites and the houses of the village are scattered over four hamlets, the old site and the Mhars' quarters on rising ground to the south of the railway, a group of tanners or Chambhars' huts some way to the east and the New suburb now the main village lining the Bombay road near the centre of the hollow. Between the now village and the western spur is a large reservoir. North and east, beyond the wild gorge of the Ulhas, stretch waving grassy uplands, sprinkled with trees and with patches of brushwood and hill tillage. To the north, behind the uplands, rise the bare tops and slopes of the double-peaked Rajmachi, and the more distant flat crest of Dhak, and, nearer to the east, the tamer slopes of the Gira or Tungarli hills. To the south-east the spurs that part the Ulhas and Indrayani rise towards the south and join the east end of the Bhoma-Umbhari range which stretches about two miles from east to west at from 300 to 500 feet above Khandala, rising from the Vajiri pass in the centre, east into the Bhoma plateau and west into the bare bluff of Umbhari. In the extreme south-west, behind Umbhari, stands the sharp clear-cut cliff known as the Duke's Nose or *Nagphani* that is the Cobra's Hood. [The likeness in the outline of this rock to the Duke of Wellington's nose, the head lying back on the hill side, is best seen from near Lonavla. The overhanging point and side rocks which make the peak look like a cobra in act to strike are said to be best seen from near Khopivli or Campoli at the mouth of the Bor pass.] Except the two long spurs at the ends and the gentle rise to the Vajiri pass [The Vajiri pass takes its name from Vriji Dev, a red-smeared stone, which, on the Tuesdays of *Ashadh* or June-July is worshipped with cocoanuts and grain.] in the middle, the north face of the Bhoma-Umbhari range, furrowed from crest to base by lines of deep cut stream beds, is in places thick with brushwood and small timber, and in the less steep and more open slopes is covered with grass which remains green or a rich brown after the other hill-sides are bleached and bare. To the west the spur that stretches from the foot of the Umbhari cliff

north to the Ulhas ravine has its crest covered with buildings, dwellings with groves and rows of trees, two low flat-roofed blocks of barracks, and an English chapel. Especially in the soft mornings and evening side-lights Khandala commands beautiful views down the Parana and Ulhas ravines. From the grassy thinly-wooded crests the ravines fall down bare withered slopes or in sheer rugged cliffs, through gentler bush-clad banks or terraces and cool deep-wooded dells, into the sheer walls of rock that overhang the stream beds. Further on, as the gorges join and broaden into a valley, the stream winds slightly to the east round the broad base of Beran or Nath Pathar whose withered and rocky upper slopes end in a broad coppice-covered plateau, crowned near the west by two grassy knolls Skirting the base of Behran the deep wooded valley and lower slopes of the Ulhas, lightened by grassy glades, stretch north till in the distance the valley is crossed by a spur from Rajmachi hill. Except that their crests burn from yellow to white or red, the masses of foliage in the valley and lower slopes grow thinner, the brown grassy glades whiten and the streams slowly run dry, the larger ravines that are cleft down to the Konkan keep their main features unchanged throughout the fair season. On the other hand the uplands and shallow Deccan valleys which, during the rainy month are a one-toned green and in the dry season are bleached and yellow are full of colour in October. The deep grass, white only on steep rocky slopes, passes through bright or pale yellow and gentle or ruddy brown in the deeper soiled uplands, to the softest green in hollows and stream beds. In the valleys and lowlands the harvested rice plots, still moist and soft, are gay with small grasses and marsh flowers, other unreaped rice fields are masses of gold or white framed- by lines of brown-gray grass; while in the damper hollows, flooded from some tiny channel, are beds of late rice with gray nodding plumes and sharp quivering leaves of the brightest green.

Houses.

Of the 280 Khandala houses seventy-five are of the first class, forty-five of the second, and 160 of the third class. Of these, eleven are on the original village site, eleven in the Mhars' quarters, four in the Chambhars' hamlet, and the rest in the new suburb or scattered over the hollow.

Stock.

The stock returns show thirty-four bullocks, 120 cows, and forty buffaloes thirty-five of them female and five male, five horses, and fifty-eight sheep and goats. There are nine two-bullock ploughs, and six bullock carts and one riding cart. The fields, chiefly in the upper valleys to the east, yield rice, *nagli*, *vari*, and *sava*.

People.

Among the 565 people of the village proper, besides Maratha Brahmans and Kunbis are an Osval Shravak, three families of Lingayat Vanis, two Pardeshis one a Thakur the other a man of low caste, two Sonars, a Lohar, a Kasar, a Namdev Shimpi, a Nhavi, a Dhobi, two Pujari Kolis, and several families of Chambhars and Mhars. There are nine houses of Musalmans and one or two of Christians. Europeans and Parsis visit the village in the fair

season but none stay during the whole year. There are nine shops, three kept by Lingayat Vanis grocers and grain-dealers, one by a Marwar Vani a grain-dealer and moneylender, one by a tailor, two by goldsmiths, and two Liquor-shops one for European the other for native fermented liquor.

Trade.

During the fair season twenty or thirty bulloek-earts pass up and down the Bombay road daily, besides a few ponies and some droves of pack bullocks. The cartmen are Deccan Kunbis, Telis, and Musalmans, belonging chiefly to Poona and Ahmadnagar. They make three or four trips in the fair season, taking wheat, millet, oil, butter, onions, potatoes, raw sugar, cotton, *kulthi*, a dye called *tarvat*, pepper, and coriander seed; and bringing back chiefly salt from Panvel and Pen and to a less extent rice, date, and cocoanuts. The bullock packmen are chiefly Lamans from the eastern Deccan who take millet, wheat, and linseed and bring back salt which is the only article it pays them to carry. They make two trips a year. Ponies, belonging chiefly to Kunbis and Musalman Bagbans, take betel-leaf or *pan* to Pen and Panvel and come back either empty or with loads of dried fish. These ponies make about two trips a month. Men are sometimes met carrying headloads of grain, chiefly rice and *nagli*. They are almost all Musalmans and Kunbis and come from Khopivli, Karjat, and other villages near the foot of the Sahyadris.

The railway station, in the south-east of the Khandala hollow, is surrounded on the east south and west by ridges, hills, and wooded knolls. Northwards the country is open rising in the distance into four chief hills, the nearer and lower spurs of the Gira or Tungarli hills in the east, the flat top of Dhak and the double peaks of Rajmachi to the north, and the wooded knoll-crowned plateau of Nath Pathar or Beran to the north-west. From the station the road runs north for about 150 yards to the Bombay road which stretches in a somewhat irregular line north-west to the crest of the Bor pass. Almost the whole of Khandala lies to the west of the station and the Bombay road, between the point where they join and the barrack ridge in the west. The only parts of the village that lie beyond these limits are the old village site and Mhars' quarters on rising ground to the south of the railway; to the east three dwellings, two on high ground almost a mile towards Lonavla and a third smaller and lower about half as far; and in a hollow, a few yards east along the Poona road, a cluster of Chambhars' huts. To the north of the point where the railway and the Bombay road meet are three small dwellings, and, a little to the west, on a bare plateau that stretches north to the edge of the Paraha ravine are the travellers' bungalow [The charges at the travellers' bungalow are 2*s.* (Re. 1) for one room for a day and, night and 1*s.* (8 *as.*) for one room for a'day. There is a messman and messenger. The messman's boarding charges are, besides wine, for a hot breakfast or luncheon 2*s.* (Rs. 1), for a cold breakfast or lauchuon 1*s.* 6*d.* (12 *as.*), and for dinner 3*s.* (Rs. 1½).] and two small houses one used as an hotel. On the flat ground across the Paraha ravine to the north of the travellers' bungalow reached from the Poona road, across the little wooded ravine where the Dhobis wash, traces of a cleared carriage way and several house plinths seem to mark the site of the straw-built shed, built by Mr. Elphinstone, and often visited by him when Governor of Bombay (1819-1827). The house stands close to the edge of the rocky precipice skirting the Paraha ravine and commands a fine view west and south

to the Khandala plateau. [Colonel J. White, R. E. As early as 1811 Mr. Elphinstone had found out the charm of Khandala. In December 1811 (Colebrooke's Elphinstone, I. 243) he wrote; The deep solitude of these valleys, apparently shut from all mankind, the silence disturbed only by the waving of branches, and the picturesque arrangement of crags and woods, recall delightful ideas and lead, to the fancy of happy hours spent in the enjoyment of the pleasures of the imagination. In September 1823 (Colebrooke's Elphinstone, II. 247) he wrote from Khandala: I have this morning ridden from Panvel on to my bungalow here; I am now in my room within three steps of the cliff. My window is immediately over it. It has been raining and thin clouds are still sailing up the chasm. Nak Puner is in sight over a cloud which cover the whole of the top of the Khandala hill. The cascade though not full is in great beauty and the sound of it is the only one heard.] About a hundred yards to the west of the travellers' bungalow is a pyramid-shaped stone monument to Mr. Graham the botanist. [The inscription runs:

To
John Graham, Esqr.,
Deputy Post Master General of Bombay,
An Active Originator, Warm Supporter, and Accomplished Member
of the Agricultural Society of Western India.
Born at Westkirk on Esk 1805
Died at Kandalla 28th May 1839.
Erected by his numerous Friends throughout this Presidency
In commemoration of
The many Estimable qualities for which he was distinguished in all the relation
of Private Life and
The untiring exertion to oblige for which he was not less Conspicuous In the
Discharge of his Official Functions
And in token of their high sense
of his Disinterested Labours and Valuable Contribution
in the cause of Botanical Science.]

A few yards to the east of Graham's monument are two small tombs, one with a flat, the other with an upright stone.

[The writing on the flat stone runs:

Sacred
To the Memory
of
Wm. Byrne,

Late H. M's IV Lt. Dragoons, Who
Departed this life 28th January 1844,
Aged 59 years
Leaving a widow and a large family to lament their loss.

—0—

Weep not for me my children dear
I am not dead but sleeping here.

The writing on the upright stone runs:

Sacred
to the
Memory of
Mary Jane
Infant Daughter of
Joseph and Harriet
Duncombe
Who departed this life
On the 3rd Dee. 1842
Aged 13 months and 25 days.

On high she now doth stand
With Angel's harp and voice;
And midst the saintly band
She doth in Christ rejoice.]

Further north where the ground falls into a lower plateau is a flat stone about two feet from the ground 4½ long and three broad with a raised central square block on which a pair of foot-prints are carved. This stone marks the grave of a Hindu mason or Gavandi who died while the railway was being made.

To the west of the station, the Bombay road passes, with the post office on the right and a wooded knoll on the left, through new Khandala, a double line of low-tiled or iron-roofed houses with a stone-built school and some brick-built graindealers' and grocers' shops. Beyond this, after passing over the railway the lake lies on the left and on the right is a second hamlet with a Parsi rest-house, a blacksmith's and a butcher's shop, and some other houses chiefly of lower class Hindus. On a wooded knoll to the right stands a dwelling house, the property of Sir Jamsetji Jijabhai. To the left in front are the rest-quarters for troops and a rest-house for travellers and the Roman Catholic church. To the south at the mouth of the Vajiri pass are two small dwelling-houses, and in the west on

the barrack spur surrounded by casuarina trees is the Khandala hotel, further to the north a smaller house used as officers' quarters, the barrack outhouses, two long flat-roofed blocks of barracks, another set of outhouses, and a hospital, and a little further to the north the English chapel. At the end of the cliff with rows of tall casuarina trees is Bairamji's bungalow overhanging the Ulhas valley. [Near the west wall of the garden of Mr. Bairamji's house is a pillar about a foot square and four feet high covered with rich much worn carving. Among the figures are more than one small seated images. The pillar is said to have been brought from near the reversing station by a Mr. Adam who was employed in making the railway.]

Trips.

Half Day.

The old forts, rock-temples, and sacred groves in the country round make Khandala a convenient centre for a number of trips. These trips may be divided into two classes, half-day trips and whole-day trips. Of the half-day trips the simplest is to walk, ride, or drive two miles to Lonavla, walk about three quarters of a mile through its sacred grove, and come back up the steep grassy slope of Bhoma hill along its rolling plateau and back *by* the bush-clad Vajiri pass, a round of about six miles. The crest of the Vajiri pass, or still better, the top of the Umbari scarp to the west, commands an excellent view of the Thana and many of the West Poona hills. North, across the upper gorge of the Ulhas, rise the plateau and the double-fortified peaks of Rajmachi, and behind Rajmachi the distant masses of Jivdhan and Nana's Thumb, the watchers of the Nana pass. A little to the right of Rajmachi is the flat crest of Dhak, and behind, through a break in the range, the Kusur pass hills. Further east and closer at hand are the lower and tamer spurs of the Gira or Tungarli hills. The eastern view of the Indrayani valley is hidden by the ridge of the Bhoma hill. To the south, beyond the lands of Kuranda where the Indrayani takes its rise, is the bare western cliff of Sakarpathar and to the left the three nobs of Devha rising by rugged steps to the jagged head of Morgiri or Jambulni. Behind the bare western scarp of Sakarpathar rise the two isolated peaks of Koari fort and Malegar backol by wild lofty ranges, the Mulshi hills behind Koari and the Tel Baili hills behind Malegar. To the west, beyond the Sahyadri ravines, stretch the rice fields and grass uplands of the Patalganga valley with the tree-fringed lake of Khopivli in the foreground, and down the centre of the valley the long rows of trees that mark the line of the Bombay high road. Beyond the Sahyadri spurs, that form the southern limit of the Patalganga valley, rises the massive block of Manikgad on the borders of Pen and Karjat; behind Manikgad stretches the water of the Apts creek, and still further west, out of Bombay harbour, rises the round-topped hill of Karanja. To the right of Khopivli, beyond the railway spur, stretches the flat top of Matheran, and the rugged crags of Bava Malang, and to the south the level crest of Prabal and the sharp point of False Funnel. Behind the south shoulder of False Funnel are the Persik hills and, further to the west, Salsette rising in three chief groups, Satkhindi behind Thana in the north, the Kanheri group in the centre, and the hills round Vehar in the south. Further to the north, rising close at hand from the Ulhas ravine, is the wooded knoll-crowned plateau of Beran or Pathar and a group of distant hills centering in

the rugged mass of Mahuli. Across the Ulhas valley from Beran, Rajmachi Bhimashankar and the watchers of the Nana pass complete the view.

A second trip, which also is best made on foot, is, after passing two miles along the Lonavla road to the railway gate which leads to the Lonavla grove, to turn north across the Tungarli rice-lands and climb the Gira range that divides the villages of Tungarli and Kunch. From its central position Gira commands a finer view than almost any except the highest hills. To the north, bounded to the right by flat-topped ridges in the lands of Kuli, Pangloli, and Valvandi, stretches the wild wooded crest of the Sahyadris, gashed by the branch of the Kachal gorge, that, all but a narrow neck, cuts off Rajmachi from the Deccan. Behind Rajmachi are the distant out lines of Bhimashankar, Jivdhan, and Nana's Thumb. Over the narrow neck, to the east of Rajmachi, rises the massive level outline of Dhak, and, further to the right, range rises behind range till the view is closed by the Takir spur three miles from Khadkala. East and south-east lies the Indrayani valley, the level rice-lands broken by wooded knolls, and bounded on the south by the wild clear-cut outlines of Kuvara, Batrasi, Visapur, Lohogad, and the Sakarpathar plateau, behind which rise the lofty peaks of Morgiri or Jambhulni, Koari fort, and Saltar. To the west lies the hollow of Khandala bounded to the south by the Bhoma-Umbari range and ending northward in the rugged gorge of the upper Ulhas stretching to the base of the wooded plateau of Beran or Nath Pathar, behind which rise Matheran and Prabal, and, in the distance, the Salsette hills and the Bombay harbour. After reaching the crest of the Gira hill the path runs east along the hill-top till it turns down a steep gorge through a grove of old trees and huge climbers. It then crosses the rice-lands of Pangloli back to Lonavla and Khandala. The whole distance is about nine miles.

A third trip, which, like the two former trips, should be made on foot, is south through the Vajiri pass in the Bhoma-Umbari range down into the lands of Karvanda, up a steep zigzag grassy path, about three miles to the top of the Duke's Nose or the Nagphani that is Cobra's Hood, which commands a wide view like, and, in some respects, finer than the view from the Umbari bluff. Then back to within half a mile of Karvanda, turn to the west keeping the gaunt scarp of Nagphani to the right, and wind along a rugged uneven path through the rich forest that stretches to the foot of the Sahyadri slopes. Towards the north the wood grows thinner and the path, crossing the crests of spurs and winding along the edges of ravines, keeps fairly level till it reaches the grassy plateau on which stands the Khandala hotel. The whole distance is about nine miles.

A fourth half-day trip, which can be done only on foot and is best suited for a morning walk, is along the Bombay road to the first turn below Bairamji's bungalow. Then leaving the road, pass along a path that slopes down the west side of the ravine till it is crossed by the railway, keep to the railway for about 500 yards, and, leaving it when it enters a cutting, take to the left hand zigzag up the steep southern face of Beran or Nath Pathar.

From the crest of the hill, which is about 125 feet above the travellers' bungalow, pass west, through blanched grass and stunted coppice, about a mile and a half to the top of either of the knolls. [The chief trees are: *rundi karand* Cassia carandas, *gela* Randia dumetorum, *toran* Zizyphus rugosa, *jambhul* Eugenia jambolanum, *anjani* iron wood

Memecylon edule, *kusar* Jasminum latifolium, *palur* Ficus cordifolia, *laigunda nana* Lageratsemia parviflora, *bonda aulu* Vanguiera edulis, *rameta* Lasiosaphon eriocephala, *asan* Briedelia retusa, and *varas* Heterophragma roxburghii.] Beyond the knolls, the hill top stretches in a second but shorter plateau, the part of the hill east of the knolls being known as Beran and the west as Nath Pathar. The view to the north is over the Ulhas valley with, in the distance, Dugad north of Matheran and Mahuli further to the right. To the north-east are the steep bare sides and flat plateau of Rajmachi with its two fortified peaks. Behind Rajmachi rises Dhak, and beyond a deep bay in the line of the Sahyadris, Bhimashankar, Jivdhan, and Nana's Thumb. To the east and south-east, beyond the Ulhas gorge, are the peaks along the south of the Indrayani valley, the rounded Kuvara, the pointed Batrasi, the long flat of Visapur, and the short comb-back of Lohogad. Further to the south are the isolated peaks of Tung and Tikona and the jagged outline of Morgiri or Jambulni. To the south rise the pointed scarp of the Duke's Nose and in the distance the heights of Telbaili and Tamani. To the left is the heavy bluff of Manikgad and the range that centres in the pillarlike peak of Karnala or Funnel Hill. Further to the left are the smaller pillar of False Funnel, and the long flat backs of Prabal and Matheran. The Beran plateau is badly off for water. About a month after the rains some families of Dhangars come bringing herds of cattle. There are then some pools at the eastern foot of the knolls. But these pools soon dry and there is seldom water later than January.

Whole Day

There are six chief whole-day trips, two east one to the Vehargaon or Karle and Bhaja caves and the other to the forts of Lohogad and Visapur; one south-east to the Bedsa caves; one south to Sakarpathar; one west to the Gambharnath cave; and one north to Rajmachi fort.

For the Karle and Bhaja caves the only route in the beginning of the fair season is to ride or drive to the Karle travellers' bungalow about six miles; ride or walk to the Karle caves and back to the bungalow about three miles; breakfast at the bungalow; and in the afternoon ride or walk to the Bhaja caves about three miles, and back six miles to Khandala. The whole distance is about twenty miles. In the later part of the cold and during the hot season (March-June) the pleasantest route is to drive or ride by the old Poona road along the south limit of the Indrayani valley about eight miles to Bhaja; from Bhaja about two miles to the Karle bungalow, breakfast, and in the afternoon drive or ride two miles to the Karle caves and back by a cross country track that joins the main road near the village of Vakshai about two miles west of Karle. The whole distance is about eighteen miles. The caves are described under Vehargaon and Bhaja. The second whole-day trip to the east is, in the early part of the cold season, to ride or drive to Karle, from Karle to walk or ride about two miles to Bhaja, and from Bhaja to walk up a pass to the plateau from which Lohogad rises on the right and Visapur on the left. Visit Lohogad, and then going east, up the south face of Visapur, cross the hill and come down along the plateau above the Bhaja caves; then back to Karle and home by the main road to Khandala. In the later part of the fair season and during the climb weather the pleasantest way of seeing Lohogad and Visapur is to take the old Poona road, and leaving it at the

village of Avadhi, to climb the pass, cross the Lohogad plateau, climb Lohogad and examine the fort, descend to the plateau and passing on to Visapur cross the hill and return, meeting horses or a pony-cart at Bhaja. The whole distance is about eighteen miles. Details are given under Lohogad and Visapur.

The trip to the Bedsa caves is along the old Poona road and under Lohogad eleven miles to Pimpalgaon; climb the hill; go down the back a few hundred feet; and pass about one and a half miles to the caves, and return by the same route. The whole distance is about twenty-five miles. The caves are described under Bedsa.

The next trip is to the southern hills either through the Vajiri pass about four miles or round by Lonavla eight miles to the top of Sakarpathar. From Sakarpathar trips may be made in almost any direction. One of the best is about four miles south to the great Devgad wood.

The trip to the Brahmanic rock temple of Gambhirnath in the north face of Beran or Nath Pathar can be done only on foot. The way is the same as to the top of Beran hill, except instead of leaving the railway at the first cutting, keep along the line through six tunnels to about 500 feet below Khandala. Then, leaving the-railway on the right, climb a steep hillside about 150 feet above the railway with roughly cut steps near the top. From this the path leads for a short distance along a rough rocky ledge under an overhanging scarp with an outer row of very old *Michelia champaca* or *champha* trees. In front of the cave, which from its very sloping roof seems to be partly at least a natural cavern, is a rude frame supported on four pillars with a sloping roof roughly thatched with plantain leaves. [There was once a strong well built porch which was burnt clown.] Details of the cave are given under Jambrug in the Thana Statistical Account. [Bombay Gazetteer, XIV. 108-110.]

The path to Rajmachi fort in the north-east begins with a long bend to the east. It then winds along the rough crest of the Sahyadris, round the top of the deep Kachal valley, across a narrow neck or isthmus and round, up a steep pass, to the plateau from which rise the double fortified peaks of Manranjan on the west and the higher and steeper Shrivardhan on the east. The way back is across the same neck and along the same rough plateau and as the distance is about twenty-four miles, the whole of which must be done at a walk and most of it on foot, it is difficult to complete the trip much under twelve hours.

[KHED.](#)

Khed, north latitude 18° 50' and east longitude 73° 57', on the Bhima, twenty-five miles north of Poona, is a municipal town, the head-quarters of the Khed sub-division, with in 1872 a population of 6446 and in 1881 of 7015. The limits of the Khed township include the enormous tillage area of 13,060 acres or upwards of twenty square miles and about twenty-four hamlets. The town has good camping grounds especially in a mango grove about a mile to the east, and a rest-house for native travellers on the Bhima near the Ahmadnagar road. Besides the sub-divisional revenue and police offices Khed has a sub-

judge's court, a municipality, a dispensary, a Government school, a post office, the tomb of the Moghal general Dilavarkhan and three temples.

The municipality was established in 1863. In 1882-83 it had an income of £45 (Rs. 450) chiefly from a house-tax and an expenditure of £80 (Rs. 800). The dispensary was opened in 1876. In 1882-83 it treated twenty in-patients and 4187 out-patients at a cost of £69 (Rs. 690). Dilavarkhan's tomb and mosque lie to the north of the town just outside the Delhi gate. They are surrounded by a wall enclosing a large plot of land most of which is under cultivation. The shrine is domed and built on a raised platform, the upper part of which is ornamented all round with a hanging wreath of sculptured flowers. The outside is quadrangular with a minaret flanking the dome at each corner. The four walls are adorned each with a double row of three blank arches, the centre arch in the lower and the two side arches in the upper row being minutely cusped. The shrine contains two tombs said to be of Dilavarkhan and his brother. [A third brother of Dilavarkhan is buried at Rahimatpur in Salara.] An inscription over the entrance shows that the tomb was built in 1613 (H. 1022) or early in the reign of Jahangir (1605-1627). The small mosque to the west of the tomb is a graceful specimen of Musalman carved-stone work. It is built on a raised platform and has a double row of three arches.

Temple:

The three temples are of Tukaidevi, Siddheshvar, and Vishnu. The temple of Tukaidevi at Tukaivadi lies a few yards to the right of the Poona-Nasik road. The temple, which is a rough looking building, is entered from the east through a small porch with a wall and pillars on either side. The porch opens into a hall or *mandap* with twelve pillars in four rows of three each and guarded by a high parapet wall surmounted by short single-stone pillars. The pillars are rude and massive; square about the middle, then eight-sided, then four-sided, again eight-sided, and then a series of rings surmounted by a square abacus which is topped by a heavy headpiece with four projections. A flat stone roof rests on the pillars and recedes slightly beneath each set of four pillars. The external roof of the hall or nave is flat with a pot or *kalash* at each of the four corners and a small spire where the hall roof meets the shrine. The shrine has an oval dome with a rude minaret at each of the four corners. In front of the temple is a one-stone lamp-pillar. The temple of Siddheshvar stands among trees on the Bhima about half a mile east of the town. The building includes a nave, a transept, and a shrine. It is entered from the north through a small porch whose roof rests on two pillars. The shrine has a pyramidal and fluted or ribbed roof with a dome above and some snake ornaments adorning the ribs on the east and west. Over either transept is a smaller dome and a very small one over the nave. The projecting entablature of the temple is adorned underneath with pendent abaci ending in what looks like a *ling* and with an occasional figure. A Sanskrit inscription over the doorway shows that the temple was built by Trimbak Mahadev a Vani in 1725 (S. 1647). A fair is held on the *Mahashivratri* Day in February-March. To the north-east of the temple is a ruinous corridor rest-house of brick and mortar. Its eastern side consists of four cusped arches, and the north side of seven arches of which the middle only is cusped. The flat roof is ornamented with a pierced cornice. To the north of the temple is a small pond with flights of steps on the east north and south. On the west the corridor has

eight pillars and two pilasters in its frontage towards the pond. The north steps are broken by two small shrines facing similar shrines on the south. About a mile south of Khed on the Bhima is a temple to Vishnu built about 1830 by Chandiram an ascetic. A small fair is held at the temple on the dark eighth of *Shravan* or July-August.

In 1707 Khed was the scene of an action between Shahu and the party of his aunt Tarabai the widow of Raja Ram. Dhanaji, the general of Tarabai, did not support her minister the Pant Pratinidhi who fled to Satara. [Grant Duff's *Marathas*, 185.]

KEDGAON.

Kedgaon village in Bhimthadi about twelve miles north of Poona, with in 1881 a population of 1572, has a station on the Peninsula railway 331 miles east of Poona. The 1880 railway returns showed 17,802 passengers and 489 tons of goods.

KIKVI.

Kikvi, a large village twelve miles south-west of Sasvad, with in 1881 a population of 1563, has a weekly market on Saturday.

KOARIGAD FORT.

Koarigad Fort, in the Mulshi petty division on the Poona-Kolaba frontier, rises on a flat topped detached hill commanding the Ambavni pass about twenty miles south of the Bor pass and about forty miles west of Poona. Stretching north and south with an extreme end pointing north, the fort is about a mile and a half in circumference. The ascent lies over a steep gorge, and the passage to the main entrance, which is completely covered with fallen masonry, leads on the north-east to a ruined gateway standing among blown-up walls. There is another on the west or weakest side of the fort. It is much more difficult than the main entrance, being steeper and up the rugged face of the rock. The defences include a wall banquette round the top, embrasured for guns at irregular intervals, and provided with embrasured towers at the corners. The top is flat and much of it is occupied by two large ponds supplied with abundant water and by a ruined temple of Koaridevi. [When the fort was deserted in 1818 the temple ornaments which were valued at about £50 (Rs. 500)' were brought to Bombay and made over to the Mumbadevi goddess.] Seven large cannon lie on the hill, Lakshmi, the largest of them, being pointed to command the Ambavni pass.

History.

In 1486 Koari was taken by Malik Ahmad afterwards the first Ahmadnagar king. [Briggs' *Ferishta*, III. 191.] In the latter part of the seventeenth century, according to Koli tradition, a Koli Lumaji Bhokhar, the chief or *naik* of Pimpalgaon in the Mahad valley, was anxious to be *sarnaik* or head of the Kolis. To gain the favour of the Musalman government Lumaji brought word that there was a splendid horse in Koari fort. If he was given some money he would try and get it for the emperor. The money was advanced, the

Kolis of all the fifty-two valleys gathered, and surrounded the fort. At the end of a year, as the siege had made no progress, the Musalman governor threatened that unless they took the fort in a month a number of them would be put to a disgraceful death. Many of the Kolis fled, but Lumaji and some of his friends dressing as woodmen got into the fort and bribing one of the garrison by his help got a ladder fastened at the top. Lumaji and his friends came down from the fort and then with a band of their followers began to climb. When they reached the foot of the rock from whose top the ladder was hanging they found the ladder was seven or eight feet short. One got on the back of another and a third on him and so reached the ladder and seventy or eighty made their way to the fort. They overpowered the guard and secured the horse. They were carrying it off in triumph when one of the garrison shot it dead. The Musalman governor was so pleased with Lumaji's daring that he raised him to the rank of a noble and enriched him. In the Maratha war of 1818 Lieutenant-Colonel Prather advanced to Koari after taking Lohogad, Visapur, Rajmachi, and Tung and Tikona in Bhor territory. Its difficulty of access from the Karle valley showed considerable obstruction to the progress of the detachment; and one attempt to communicate with the road leading to it from Poona proved ineffectual. Another avenue being found. Lieutenant-Colonel Prather came before the place on 11th March with an advance party which drove in the enemy's outposts, [For the reconnaissance and investment of the fort Lieutenant Remon of the Engineers and a party under Captain Hose of His Majesty's 89th Regiment were detached from Scroti six miles south east of Koari on the morning of the 11th and they completely succeeded in their object of gallantly driving in the enemy who were advantageously posted on a height protected by a well directed fire from the fort guns. The besieging force with knapsacks on the shoulders of the men the after a inarch of six mites advanced to the charge up a steep hill to the very wall of the fort, the besieged keeping up a brisk fire of cannon and musketry, Bombay Courier, 28th March 1818.] leaving the remainder of the detach- ment to follow under Major Hall of His Majesty's 89th Foot which arrived on the following day with the exception of the heavy. train. Even this had been greatly lightened by leaving at Lohogad two eighteen-pounders and one of the thirteen-inch mortars. On the 13th a fire from the smaller mortar opened against the place and produced immediately an evident conflagration, while another battery was in a state of forwardness, opposite the north-eastern gateway, which was the chief access to the fort. On the morning of the 14th at daybreak, this likewise opened with good effect from one thirteen, one ten, and two eight-inch mortars, and about seven in the evening the enemy's magazine was seen to blow up which laid the chief gateway in ruins and burnt several of their houses. This induced the garrison to demand a suspension of hostilities, which was followed an hour afterwards by their surrender. About 700 men supposed to include some of those who had fled from Visapur and Lohogad and the commandant Janoba Bhau were taken prisoners. The loss of the detachment on this occasion was twelve men including one officer of Engineers slightly wounded, and that of the enemy about thirty-five most of whom were killed at the' explosion. Treasure valued at about £10,000 (Es. 1 *lakh*) and some-grain were found in the fort. The fall of Koari was followed on the 17th by the surrender and occupation of the dependent fortress of Gangad about eight miles to the south. [Blacker's Maratha War, 247-248.]

[KOREGAON.](#)

Battle, 1818.

Koregaon, village, twenty-five miles south-west of Sirur and about sixteen miles north-east of Poona, with in 1881 a population of 960, is famous for its successful defence on the 1st of January 1818 by 800 British troops against 30,000 Marathas. Towards the end of December, in the pursuit of Bajirav Peshwa which followed the battle of Kirkee (5th November 1817), news reached Colonel Burr, who was in charge of Poona, that Bajirav was passing south from Junnar and meant to attack Poona. Colonel Burr sent to Sirur for help. The second battalion of the first regiment Bombay Native Infantry of 500 rank and file under Captain Francis Staunton, accompanied by 300 irregular horse and two six-pounder guns manned by twenty four European Madras artillerymen under a Serjeant and a Lieutenant, left Sirur for Poona at eight in the evening of the 31st of December. After marching all night, a distance of the twenty-five miles, about ten in the morning, from the high ground behind Talegaon Dhamdhere, they saw across the Bhima the Peshwa's army of 25,000 Maratha horse. Captain Staunton marched on as if to ford the river, then turned, and took the village. Koregaon was surrounded by a mud wall of no great strength. [Grant Duff (Marathas, 656) describes the wall as full of large breaches on the river side and completely open on the east. This was its state at the end of the siege.] Captain Staunton secured a strong position for his guns and awaited the enemy's attack. As soon as the Maratha horse saw the British they recalled a body of 5000 infantry which was some distance ahead. When the infantry arrived three parties, each of 600 choice Arabs Gosavis and regular infantry, under cover of the river bank and supported by two guns, advanced to storm the village on three points. A continued shower of rockets set on fire many of the houses. The village was surrounded by horse and foot and the storming party broke down the wall in several places and forced their way in and secured a strong square enclosure from which they could not be dislodged. Though the village stood on the river bank the besiegers cut them off from water. Wearied with their night's march, under a burning sun, without food and without water, a handful of men held an open village against an army. Every foot was disputed, several streets and houses were taken and retaken, but more than half the European officers being wounded, the Arabs made themselves masters of a small temple, where three of the officers were lying wounded. Assistant Surgeon Wingate, one of their number, got up, and went out, but was immediately stabbed by Arabs and his body mangled. Lieutenant Swanston, who had two severe wounds, advised his remaining companion to suffer the Arabs to rifle them, which they did but without farther violence. In the meantime, a party of the battalion under Lieutenant Jones and Assistant Surgeon Wyllie, came to the rescue, retook the temple and carried their companions to a place of greater safety. Thirst drove the besieged nearly frantic and some of the gunners, all of whom fought with glorious bravery, thinking resistance hopeless, begged for a surrender. Captain Staunton would not hear of yielding. The gunners were still dissatisfied when their officer, Lieutenant Chisholm, happened to be killed and the enemy encouraged by his death rushed on one of the guns and took it. Lieut. Pattinson, Adjutant of the Second Battalion, a man six feet seven inches in height, of giant strength and heroic courage, was lying mortally wounded shot through the body. Hearing that the gun was taken he called on the Grenadiers once more to follow him, and, seizing a musket by the muzzle, rushed into the thick of the Arabs and felled them right and left till a second ball through the body disabled him. He was nobly seconded, the gun

was retaken, and dragged out of a heap of dead Arabs. Lieutenant Chisholm's body was found with the head cut off. This is the fate, cried Captain Staunton, of all who fall dead or alive into Maratha hands. The gunners took the lesson to heart and fought on with unflinching courage, and the defence did not slacken though only three officers, Captain Staunton, Lieutenant Jones, and Assistant Surgeon Wyllie, remained fit for duty. Towards evening their case seemed hopeless. As night fell the attack lightened and they got water. By nine the firing ceased and the Marathas left. Of the 834 defenders of Koregaon 275 were killed wounded and missing, of whom were twenty of the twenty-six gunners. [The details are: Second battalion First Regiment, 500 rank and file and five officers, Captain Staunton, Lieutenant Pattinson killed, Lieutenant Conellan wounded, Lieutenant Jones, Assistant Surgeon Wingate, killed. Artillery, twenty four men and two officers, Lieutenant Chisholm killed and Assistant Surgeon Wyllie, Auxiliary Horse 300 men and one officer, Lieutenant Swanston wounded. Grant Duff's Marathas, 658 footnote 2.] The Marathas lost between 500 and 600 killed and wounded. In reward for the defence of Koregaon which General Sir T. Hislop described as 'one of the most heroic and brilliant achievements ever recorded on the annals of the Army' the second battalion of the First Regiment was made Grenadiers as the first battalion had been made for the defence of Mangalur. The motto of the regiment became Mangalur and Koregaon. [Grant Duff's Marathas, 658 footnote 1.] Captain Staunton was appointed an honorary aide-de-camp to the Governor General and presented by the Court of Directors with a sword ornamented with a suitable inscription and a sum of 500 guineas. On attaining the rank of Major in 1823 Captain Staunton was appointed a companion of the Most Honourable the Military Order of the Bath. [The sword was presented to Captain Staunton on the 1st of January 1820 by the Honourable Mountstuart Elphinstone. Five years later Lieutenant-Colonel Staunton, C. B., died on the 25th of June 1825 off the Cape of Good Hope. Historical Record, 2nd Grenadier Regiment, 19-34,39.] Mr. Elphinstone, who visited Koregaon two days after the fight (3rd January 1818), found every sign of violence and havoc. The houses were burnt and scattered with accoutrements and broken arms, and the streets were filled with the bodies of dead men and horses. The men were mostly Arabs and must have attacked most resolutely to have fallen in such numbers. Some wounded were treated with the same care as the British wounded. About fifty bodies within the village and half a dozen without, with the wounded and the dead, made not less than 300. About fifty bodies of sepoys and eleven Europeans, besides the officers, were found imperfectly buried. [Colebrooke's Elphinstone, II. 16-17.]

Obelisk.

At [Murray's Bombay Handbook, 304-305. Compare Jacquemont Voyage dans l'Inde, III. 544.] the eminence near the river is a round stone tomb, where the artillerymen killed in the action were buried. At this point the river is crossed, and 300 yards to the left of the Poona road on the opposite bank is an obelisk 65 feet high of which 25 feet is pediment 12' 8" square. It stands on a stone platform 32' 4" square. The obelisk is of polished hard stone, and is enclosed with a stone wall six feet high on three sides, and an iron railing with a handsome iron gate and two lamps on the west side. The inscription on the north and south sides is in Marathi; and the inscription on the west side given below is in English. The inscription on the north and east sides gives the names of the English killed

and wounded, and of four natives attached to the artillery who were killed, from which it appears that of the eight officers engaged three were killed and two wounded, and of the twenty English artillerymen eleven were killed. The English inscription on the west side is:

Inscription.

This Column
is erected to commemorate the defence of Coregaum
by a Detachment commanded by Captain
Staunton of the Bombay Establishment
which was surrounded on the 1st of January 1818
by the Peshwa's whole army under his
personal command,
and withstood throughout the day a series of
the most obstinate and sanguinary assaults of his best troops.
Captain Staunton,
under the most appalling circumstances,
persevered in his desperate resistance,
and, seconded by the unconquerable spirit of
his Detachment,
at length achieved the signal discomfiture of
the Enemy
and accomplished one of the proudest
triumphs
of the British Army in the East.

To perpetuate
the Memory of the brave troops
to whose heroic firmness and devotion it owes
the glory of that day,
the British Government
has directed the names of their Corps and of
the killed and wounded
to be inscribed on this monument.

MDCCCXXII.

[Compare Chesson and Woodhall's Bombay Miscellany, VII. 46-48.]

KURKUMB.

Kurkumb, a small village of 911 people, on the Poona-Sholapur road, seven miles south-east of Patas station and about twenty miles north of Baramati, has two temples built in honour of Phirangadevi, one in the village and the other on a neighbouring hill. The larger temple of cut and polished stone is eight-sided with an audience hall or *sabhamandap* and verandas on both sides. The other temple on the hill is smaller and was built by Sambhaji Naik Nimbalkar, Deshmukh of Phaltan in 1759 (*Shak* 1681). It contains a Marathi inscription in Devnagari characters dated *Shak* 1681 (A.D. 1759) recording the name and the pedigree of the builder of the temple.

LOHOGAD AND VISAPUR.

About four miles south of the Karle cave hills and eight miles south-east of Khandala, in the range that forms the southern limit of the Indrayani valley, stand two fortified hills. Lohogad to the west short and comb-backed, and Visapur long and level to the east. From the village of Bhaja, about a mile south of the Karle railway station, a path leads up the face of a slightly wooded spur to the plateau from which rise the sheer cliffs of Lohogad on the right, and the tamer sides of Visapur on the left. From the top of the pass, between two hills, the track divides, one branch running west below the cliffs of Lohogad, the other east below the slopes of Visapur. This is the simplest path up either of the hills and is open all through the fair season. During the hot months (March-May) the pleasantest way of seeing Lohogad and Visapur from Khandala or Lonavla, is to start from the western village of Avadholi, climb Lohogad from the south, and passing to Visapur, scramble up the steep rugged gorge in its south face, and, crossing the hill, return by the north ravine along a smooth part-tilled plateau and down the steep hill-side that

overhangs the village of Bhaja. From Lonavla, keeping to the right under the southern range of hills, a rough cross country road follows the line of the first English highway between Poona and the Bor pass, [Though rough and in places entirely destroyed this road can still be clearly traced. It is locally known as the Peshwa's road, and may be on the line of a Maratha highway, but the remains of pavement and metalling seem English.] about four and a half miles south-east to Avadholi. The closer view of Lohogad shows a long rocky point, known as the Scorpion's Sting or *Vichu-kanta*, running north-west from the main body of the upper hill, and ending, over the Avadholi valley, in a bare black fortified crag. From Avadholi the path leads up a steep well wooded pass to a rolling plateau with scattered trees and patches of tillage from which, on the left, rises the black cliff of Lohogad fort. At first under the Scorpion's Sting, a cliff about 300 feet high, and then, under the bare scarp of the main hill whose walled crest, connected with the Scorpion's Sting by an arched gateway, rises about 150 feet higher, the path leads through about two miles of open woodland and hill tillage to the shady village of Lohvadi. To the left of Lohvadi are the sites of some large buildings, the dwellings of the local *deshmukhs* who had formerly large mansions and a well and garden. A filled up well may still be seen, in which according to the local story at a wedding the child bride and bridegroom fell were drowned and the place was deserted.

The Way Up,

Behind Lohvadi a path leads to the sole entrance to the fort, where, from among the trees, up the face of a steep spur, winds a flight of steps, partly built partly rock-cut, guarded by four arched gateways, each flanked by double bastions rising one above the other, the highest standing clear against the sky. [According to Lord Valentia (1803) the gateways take away from the strength of the place by offering a lodgment for a storming party. Travels, II. 171.] On the right, before reaching the lowest gateway, at the foot of a high rugged scarp, is a row of three caves, their mouths, except narrow doorways, closed by modern masonry walls. The first cave, known as the Salt Store, and measuring nineteen feet long by twenty-two broad and six and a half high, is plain without pillars or writing. Along the east wall are two stone benches each about six feet long by three broad and two high. Between the stone benches a door, cut in the rock, leads into a second cave, also plain and without pillars, about twenty-six feet by twenty and seven high and divided into two compartments by a modern stone and mortar wall. A door in the back wall of this cave opens on a second smaller chamber. A few yards further along the hill side is a third cave, with a masonry wall built nearly across the entrance and the inside partly filled with water. Beyond it is a large rock-cut water cistern about forty feet square and eighteen deep, the roof supported on two rough rock-cut pillars. In the bare face of the cliff, about thirty feet above this line of caves, reached by a broken flight of rock-cut steps, are two unfinished cells, the lower five feet and a half by five and the upper six by five and four high. A hole leads through the floor of the upper into the lower cave, and, when finished, the two would probably have formed one chamber. Their position outside of the defences, and the contrast between the modern masonry entrance and partition walls and the rest of the work of the lower caves, and the rough stone steps and openings into the upper caves, bear out the people's belief that these caves were not granaries but Buddhist monk-dwellings or, as they say, Pandav-hewn houses. Their simplicity and rudeness, and

their close resemblance to some of the older Junnar caves point to an early date. A little above this line of caves rises, on the left, the western bastion of the first or Ganesh Gate. This was the first of the additions made by Nana Fadnavis about 1789. There is still a generally believed, and apparently true, story that the building had to be stopped because the foundation of the bastion would not hold. At last Nana was warned in a dream that the defences could never be completed until the favour of the god of the hill was won by burying alive a man and a woman. After much difficulty a Maratha of the Sabale clan agreed to offer his eldest son and his son's wife. A hole was dug and the two were buried alive and over them the foundations of the bastion were again laid and have ever since stood firm. In reward for this sacrifice the headship of the village of Lohvadi was taken from a Ghadshi family and given to the Sabale whose fourth in descent is the present police patil.

Fort Details.

According to the local story, of the four gateways, the Ganesh, Narayan, Hanumant, and Maha, the first second and fourth were built in the time of Nana Fadnavis and the third or Hanumant is older and was built by the Musalmans. The gateways of all are arched in Musalman style and strengthened by masonry bastions, the windings of the steps and the heights of the gateways being so planned that the approach is commanded by all the bastions. The gates are of teak strengthened with iron, the lowest or Ganesh gate being armed against elephants by long iron spikes. Here and there in the bastions of the Ganesh and other gates are a few small dismounted guns. [On one of the guns are out the letters and figures T. P. D. 4-1-17 and on another in Balbodh the words Ali Madat and the figures 3-3-12,] Inside of the Ganesh Gate on the right hand, about the level of the roof of the gateway, is a broken image of Ganpati. A little further, about halfway to the Narayan gate, in a niche on the right, is a small broken image of Gauri, Ganpati's mother, seated with crossed feet and upturned soles, her hands resting on her knees, four bracelets on each wrist, a bodice and a tiara or *mukut* on her head. To the right, about halfway between the Narayan and Hanumant gates, are two caves, the nearer fourteen feet by sixteen and nine high, used by the Marathas as a *nachni* store, and the further, about twenty-nine by thirty feet and twelve high, used as a rice store. They are plain, without pillars ornament or writing, and, except narrow doors, have their mouths closed by masonry. Their depth, three or four feet below the entrance, and the roughness of the tool-marks, support the local belief that they are the work of men, not of the Pandavs, and were cut by the Marathas as granaries. A few steps further, before passing through the Maruti or Hanumant gateway, a rough broken image of Maruti is cut in the cliff on the right. Just above this image is the Maruti or Hanumant gateway, the original gate of the fort, which, according to the local story, was built by Alamgir or Aurangzeb, but is probably at least as old as the Ahmadnagar kings (1489-1636). A few steps above the Maruti gate the staircase is spanned by an arch or *kaman* fitted with holes for bolts and bars. A little further the staircase turns sharp to the right in front of the Maha or Great gateway, a plain wooden door set in a Musalman arch, with some slight tracery above and a small image of Maruti on either side. Within the gateway is a ruined court and guard-room with one arch standing.

Facing the Maha gate, on a stone plinth about five feet high, stands a stone mausoleum, a square tower capped, as it seems from the out side, by a rough clumsy dome. This building, which is about fifteen feet square inside, has two slightly ornamented one tombs on the floor, and rises in a plain well-proportioned dome about twenty-five feet high. It has no inscription. According to the local story it is a cenotaph in honour of Aurangzeb and one of his wives. Close to the mausoleum are the ruins of the small court-house or *dhakti sadar*, and in front, between the tomb and the cliff edge, are the remains of the armoury or *lohar-khana*. Behind the dome, the hill rises into a bare knoll about 100 feet high, and to the right, under a cliff about thirty feet high, are the well-built plinths of four courtyards or *chauks* said to be the remains of the chief Government offices or *mothi sadar*. In the rocky brow behind are a set of four caves. The cave most to the south and west has its mouth, all but a hole about two feet square, choked with earth and fallen rocks. To the north-east, behind the ruins of the chief court-house, is a cistern about twelve feet deep cut into the face of the hill, the inner part supported by a roughly hewn rock pillar. A few steps to the right, with a porch about fifteen feet by eight, is the second cave partly filled with a mud and water, the entrance blocked by rocks and earth, and with a modern wall and door built across it. Inside, a modern stone and mortar wall divides the cave, leaving, to the left, a compartment about thirty feet by twenty. From this, a few yards to the east, two rock-cut doorways lead into two small chambers, one to the left the other facing the entrance doorway. The cave is plain throughout without pillars or ornament. A few yards further, opening from a small terrace strewn with stones and under an overhanging rock, is a third cave with a recess on the right and two small chambers on the left. This cave, which is known as the treasury, *Khajandarki kothi* or *Jamdarkhana*, measures about sixty feet long by forty-five broad and about eight high. It is plain without pillars or ornament and has, along the east wall, a stone bench about three feet high, five feet broad, and twenty-seven feet long.

Slight brick partitions divide the cave into compartments about fifteen feet square, and up the middle a row of treasure-coffers, about three feet square, have been sunk in the floor. A few yards further, under an overhanging rock, about six feet deep, is a fourth cave known as the Lakshmi Kothi. The original entrance seems to have been a central doorway with rock-posts and two side windows or openings, each about three feet high and eight long, cut halfway down to the floor of the cave. But, except a doorway measuring five feet by three, the front has been closed by a modern stone wall. Inside of the door is a rock-cut hall, fifty feet by thirty and seven high, with rock-cut side benches, but without pillars ornament or figures. Part of the hall, cut off by a brick partition, has been used as a store-room; and in the roof, between the outer and inner doorways, a loop has been cut from which to hang the scales used in weighing grain and stores. In the back wall of this hall are four rough-hewn rock pillars, each about three feet square, placed so as to form a central doorway and two windows on either side, each window about eight feet long and four high, corresponding to the windows in the outer wall. A flight of three rough steps, with plain rock-cut side benches, each five feet long and three and a half wide, lead to the inner doorway. Within this doorway is a second hall, about fifty feet by nine and a half and seven high, in no way differing in style from the outer hall, except that at each end a door leads into a rock-cut chamber twelve feet by ten. Through the back wall of this second hall are reached a central and two side chambers, the central

chamber about 17' 6" by 13' 6" and each of the side chambers ten feet by fourteen. Within this central chamber is an inner shrine about eight feet by four with a small room to the left. On the back wall of the shrine are some markings and hollows which look as if a relic-shrine or other object of worship had been wrenched from the wall. The story is that this cave was the dwelling of Lomesh Rishi and that a passage once ran through the back wall of the shrine into the seer's private chamber. One of the Musalman kings is said to have spent sixty bottles of oil in lighting this passage in search of the seer, and, on failing to find him, ordered the mouth to be closed. Beyond Lakshmi's chamber are two small rough caves and a larger one, apparently about twenty feet by forty, now half filled with mud and water. This group of caves is by the people believed to be the work of the Pandavs, and though no trace of ornament figures or writing has been found, the style of the work, the position commanding a fine view south-east across the Pauna valley to the Mandvi Tikona and Morgiri or Jambhulni hills, and the neighbourhood of the old shrine of Bahiroba now the tomb of Shaikh Umar, favour the idea that it was once a Buddhist settlement. If they are Buddhist, the caves rank among the oldest class belonging to the second or first century before or after Christ. Passing over the high ground in which the caves are cut, the path leads to a walled enclosure, at the west end of which, covered by a rough thatched roof, is the tomb of Shaikh Umar Avalia an Arab saint. Shaikh Umar is said to have come from Mecca with six brothers one of whom was Bava Malang who gave his name to the hill near Kalyan in the Konkan and another Shaikh Salla of Poona. They are said to have come as missionaries before Musalman power was established in the Deccan. According to the guardian or *mujavar* of the tomb, whose family have held the post for seven generations, when Shaikh Umar came to Lohogad he found a Hindu ascetic on the hill-top whom he seized by the leg and tossed across to the Visapur plateau where his shrine is still worshipped as the *vandev* or forest-god. [It seems doubtful whether this so-called ascetic was a Gosavi and was not Bahiroba, The present *vandev* is said to be Bahiroba and has a Koli ministrant. At the top of the pass, on the way from Bhaja, is an old temple to some form of Devi with a broken dome in the cross-corner or Hemadpanti style. Closer under Lohogad on a rough plinth, are thirteen small stone horses about a foot high and a foot long, said to be the stable of Shaikh Umar. Here, in passing, Hindu women and children leave a small branch or tree-twigg. It seems probable that Shaikh Umar's stud is a survival of the old Bahiroba horse-worship.] Once a year, on the December-January or *Paush* full-moon, a fair is held at Shaikh Umar's tomb, to which about 1200 pilgrims come, Hindus of all castes as well as Musalmans, mostly from the villages round as far as Poona. One of the visitors, a Hindu of the saddler or Jingar caste, lately (1880) presented the shrine with a handsome silk covering. In a corner of the enclosure are several votive clay horses. Behind, that is to the west of, the saint's tomb, the hill rises into a steep grassy knoll about 100 feet above the level of most of the hill-top. To the north of the central knoll, about 150 yards to the west of the saint's tomb, is a masonry pond about 140 yards round and with two flights of steps leading to the water. On the east wall of the north flight of steps a Marathi inscription dated S. 1711 (A. D. 1789) states that the maker of the pond was Balaji Janardan Bhanu (that is Nana Fadnavis), whose agent or representative was Dhondo Ballal Nitsure, and the mason who built it Bajichat. This pond does not now hold water. At the time of the capture of the hill the English are said to have run off the water in search of treasure and the escape opening has never been closed. The remains of a stone structure for working a leather bag and of

water-channels to the north show that the water of the pond was once used for gardening. To the south of the central knoll and to the west of the domed tomb is a ruined temple of Trimbakeshvar Mahadev, and close to the temple a rock-cut cistern and a well of pure water. To the north-west of the pond there seems to have been a garden where the artillery apparently was parked. A few guns lie about and stone balls are found in the grass. At the north-west corner of the hill-top a path passes through an arched gateway down a rough descent of 100 or 150 feet to the strip of rock known as the Scorpion's Sting. This rock, which is about 1500 yards long and from twenty to forty yards broad, has a rough flat top and steep sides strengthened by broad masonry parapets. The walled passage at the west end of the rock, according to Lord Valentia (1803), was the beginning of a flight of steps which were planned by one of the Satara chiefs but never completed. [Travels.II. 171.]

To the west of the plateau, below the Lohogad cliff, is a hamlet of about six Koli huts. They grow hill-grains, *nachni* and *vari*, own cattle, and make butter. They are Pujari or Pan Kolis acting as temple servants to Ganpati, Maruti, Bahiroba, Khandoba, and Vithoba. The Maratha Kunbis eat and drink with them, but they do not intermarry. Their surnames are Ikare, Dhanvale, Dakole, and Shilke.

History.

Lohogad is one of the strongest and most famous of Deccan forts and is probably a settlement of very great age. Its position, commanding the high road to the Bor pass, must have always made it important, [Till quite lately the high road to the Bor Pass kept close to the southern range of hills just below Lohogad.] and its large series of caves, though not yet properly examined, would seem to show that it was a Buddhist resort at least as early as Bhaja, Karle, and Bedsa (B.C. 200 - A.D. 200). On these grounds, and from its resemblance in name and position, it seems possible that Lohogad is Ptolemy's (A.D. 150) Olochoera, one of the chief places inland from the South Konkan or Pirate Coast. In modern times it is mentioned as one of the Bahmani forts taken by Malik Ahmad when (1489) he established himself as an independent ruler. [Grant Duff's Marathas, 33.] In 1564 Burhan Nizam Shah II. afterwards the seventh Ahmadnagar king (1590-1594) was confined here during his brother's reign. [Briggs' Ferishta, III. 271, 282.] On the fall of the Ahmadnagar' dynasty in 1637, Lohogad passed to the Bijapur kings, but was soon after (1648) wrested from them by Shivaji. In 1665, after the successes of Jaising and Dilawar Khan, Shivaji was forced to cede Lohogad to Aurangzeb. Only five years later (1670), in the successful operations that followed Tanaji Malusre's capture of Sinhgad, Lohogad was surprised by the Marathas, and afterwards made a sub-divisional head-quarters and treasury. [The late Mr. G. H. Johns, C.S.] About 1704 Lohogad was taken by the Marathas, [Scott's Deccan, II. 56; Waring's Marathas, 125.] in 1713 it was taken by Angria, [Grant Duff's Marathas, 193.] and in 1720 it was given to Balaji Vishvanath. [Grant Duff's Marathas, 202.] About 1770 the fort was taken in the interests of Nana Fadnavis by a Koli named Javji Bomble. This man who was a famous outlaw had some capital rocket-men and advancing one of them to a favourable position pointed out to him the direction he was to fire. One of the rockets fell among some powder close to the door of the magazine and caused such an explosion that the garrison were forced to surrender.

[Transactions Bombay Geographical Society I. 253.] Towards the close of the eighteenth century Nana Fadnavis, when prime minister to Bajirao II. (1796- 1800), placed Dhondopant, a dependant of his own, in command of Lohogad and sent all his treasure to the fort. After Nana's death (1800) his widow (12th November 1802)[Transactions Bombay Geographical Society, XIX. 84,] took refuge in Lohogad, and Dhondopant refused to hand over the fort to the Peshwa unless Nana's adherents received certain offices. Dhondopant remained in command till 1803 when the Peshwa, under General Wellesley's mediation, agreed to allow Dhondo to keep the fort on promise of acting as a faithful subject. Shortly after, from a fort near the Krishna, a garrison of Dhondopant's fired on the Peshwa and would not allow him to pass to a temple. In punishment for this outrage General Wellesley threatened to storm Lohogad; and on promise of personal safety and of a yearly grant of £120 (Rs. 1200) to Nana's widow whom General Wellesley described as 'very fair and very handsome Well deserving to be the object of a treaty,' Dhondopant retired to Thana and the widow to Panvel. When the fort surrendered to the British it held a prodigious quantity of ammunition of all kinds. It was at once restored to the Peshwa and in 1803 (October) when visited by Lord Valentia, was strongly garrisoned, but poorly supplied with stores. [Valentia's Travels, II.166-171. Dhondopant's garrison varied according to circumstances from one to three thousand men. Ditto, 171.] Some months after the outbreak of the final war with the Peshwa (4th March 1818) a strong force under Colonel Prother was sent against Lohogad. On the capture of Visapur the garrison left Lohogad and on the next day it was taken without resistance. [Blacker's Maratha War, 247.] Till as late as 1845 the fort was garrisoned by a commandant and a few troops. [Insp. Report of Forts, Poona Division, 1845] The guard was afterwards removed but, probably because the fort could at any time be commanded from Visapur, the four gateways and other fortifications were left unharmed. In 1862, it was reported as a strong fort, the walls and gates in slight disrepair, with a sufficient supply of water, and able to hold about 500 men. [Government Lists of Civil Forts, 1862.]

VISAPUR.

Rising from the same plateau as Lohogad, about half a mile to the north, the rocky scarp of VISAPUR is crowned by a smooth bare hill-top, considerably larger than Lohogad, and, at its highest point, 3550 feet above the sea. Near the middle of its length two ravines, one running down the north, the other down the south face, narrowing its centre, hollow the hill into an hour-glass. Each half of the hill rises into a gently rounded knoll which, though showing no trace of fortifications, is dignified with the name of Bala Killa or upper fort Round the edge of the hill-top runs a wall, high and strengthened by towers along the west face. In other parts, except where the rock is not sheer and the crest has been scarped by a masonry lining or pavement, it is little more than a stone and mud breast-work. In other parts, according to the lie of the ground, the defences vary from strong walls backed by masonry platforms where the slope was naturally easy, to a mere parapet of dry stone where the plateau ends in a precipice.

From Lohvadi, at the foot of Lohogad fort, the Visapur path passes north winding among plinths of cut-stone, which attest the importance of the old *peta* or cantonment attached to

Lohogad fort, past where Shaikh Umar dismounted, a spot marked by an earthen platform and a row of small votive clay horses, and past a hole in the east point of Lohogad cliff, made by the saint when he hurled his spear against the rock in defiance of the Hindu ascetic whom he was about to oust from the plateau. The Visapur path leads over a bare rocky partly tilled plateau across the crest of the ridge which connects Lohogad and Visapur. Beyond the shoulder, the path, for about a mile and a half, runs under the sheer scarp of Visapur fort. It then turns to the left up a deep gorge, the sides crested by massive masonry bastions, along a steep rough track strewn with large boulders and broken masonry, the ruins of the Deccan gateway, destroyed when the English dismantled the fort. At the head of the gorge, hewn in the rock, is a large reservoir said to be the work of the Pandavs, built in with modern stone-work and the interior plain. The hill-top, with its two conical knolls about two hundred feet high, [By aneroid the height of the Deccan gate is 3350, of the eastern bastion 3430, and of the central height 3550 feet above the sea.] is smooth and thickly covered with grass, but, except a few old *Ficus glomerata* or *umbar* trees in a hollow near the centre of the north face, it is bare of trees.

Besides the wall round the hill-top there are three chief works, massive masonry bastions that in both ravines [The Patan gorge was not so strongly fortified as the other gorge. There were some fortifications but all were blown down and the ascent from Patan is for a considerable distance over debris.] flank the ruined central gateway, a strong masonry tower at the north-east corner, and a great outstanding masonry-lined crag that guards the hill to the northwest. The remains on the hill are, in the western half, two roofless buildings surrounded by outer or veranda walls said to have once been Government offices, and in the east half, near the southern edge of the hill, a large three-cornered stone-built pond, and close to it a rock-cut cistern. Near the north wall is an iron gun ten feet long and of four-inch bore, marked in relief with the Tudor Rose and Crown flanked by the letters E. R. This is probably a gun of Queen Elizabeth's reign robbed from an English ship and presented to the Peshwa by Angria or some other Maratha pirate. [Government Lists of Civil Forts, 1862, state that most of the guns had the letters E and R carved on their trunnions. These letters have been noticed on this one gun only. Mr. J. McL. Campbell, C. S.] Like several other guns on the fort it has been disabled by breaking off its trunnions. Near the middle of the hill-top, between the two gorges, in a small grove of old *umbar* *Ficus glomerata* trees, are the ruins of a large stone-built house known as the Peshwa's palace. Close to it are the remains of an old Mahadev shrine.

The descent, through the north or Patan gate, is for two or three hundred yards somewhat steep and rugged with fragments of the ruined gateway. Lower down, the path passes under the north-west cliff, and, beyond the cliff, stretches for about a mile across a bare open plateau. Looking back from this plateau, the vast natural defences of the two hills stretch in a long waving line. Beginning with a bold bluff near the north-east corner of the hill the line recedes to form the northern or Patan gorge, then sweeps forward to the massive outstanding north-west crag, and again slightly receding stretches along the strongly fortified western face. Further west, with only a very short break, another line of fortifications crowns the north face of Lohogad, and, with a slight drop, stretches westward along the flat crest of the Scorpion's Sting. From the western brow of the

plateau, which commands this view, down the Bhaja hill-side a smooth steep path winds quickly to the plain.

History.

Visapur fort is said to have been built by the first Peshwa Balaji Vishvanath (1714-1720). In 1818, when reducing the Peshwa's forts, the fame of Lohogad as a place of strength caused the English to make special preparations for its attack. A detachment of 380 Europeans and 800 Natives, with a battering train, summoned from the Konkan, were joined by artillery from Chakan, and the second battalion Sixth Native Infantry and a detail of the second battalion of the First. The whole force was placed under the command of Colonel Prother. [The Hon. M. Elphinstone to Gov. Gen. 7th March 1818. According to Blacker (Maratha War, 247) Col. Prother's force consisted of seven mortars and four heavy guns, 370 men of H. M.'s 89th Foot; the first battalion of the Fifth and first Battalion of the Ninth Regiments of Native Infantry; detachments of the second battalions of the Sixth and First Regiments of Native Infantry; and two companies of the Auxiliary Brigade.] On the 4th of March Visapur was attacked, and on the same day was occupied without resistance. [Blacker's Maratha War, 247.] Both the north or Konkan and the south or Deccan gateways were blown up, and except a few Dhangars' huts the hill has since been deserted. [Lists of Civil Forts, 1862.]

[LONAVLA.](#)

Lona'vla, about forty miles north-west of Poona, is a municipal town in Maval with a railway station and a population in 1881 of 3334. Lonavla lies at the top of the Bor pass and is the chief up-country centre of the south-east branch of the Peninsula railway corresponding to Igatpuri on the north-east branch. Besides the municipality and the railway station Lonavla has a post office, locomotive works, Protestant and Roman Catholic chapels, a railway school, a masonic lodge, and a co-operative store. The 1883 railway returns showed 74,688 passengers and 1547 tons of goods. The municipality was established in 1877 and had in 1883 an income of £100 (Rs. 1000) and an expenditure of £85 (Rs. 850). A railway reservoir, about two miles to the south of Lonavla, affords a fair supply of water to the town. Close to the south of the town is a large wood of fine trees hung in many parts with large thick-stemmed creepers. Along the south and west fringes of the wood are many favourite camping grounds during April and May. The wood, which covers about fifty six acres, is interesting as preserving a trace of the forest with which the West Poona valleys were probably once covered. This section of the early forest seems to have been protected out of fear for Mahadev whose shrine lies in the heart of the wood. Lonavla wood is famous for picnics and as a camping ground for visitors during the hot season (March-May). About four miles south of Lonavla is Sakar Pathar a wide waving hill-top in many ways particularly fitted for a health resort. [Details are given below under Sakar Pathar]

[LONI.](#)

Loni in Haveli, also called Loni Kalbhar, about ten miles south-east of Poona, with in 1881 a population of 2512, has a railway station and a Collector's bungalow. The station returns for 1980 show 12,621 passengers and 339 tons of goods. About two miles south of the village, in a spot called Ramachi Jaga or Ram Dara, is the tomb of one Satu Ramoshi who is said to have died about a hundred years ago. [Mr. H. E. Winter, C.S.] In 1827 Captain Clunes notices Loni as a usual halting place with 200 houses, five shops, a watercourse, and wells. [Itinerary, 27.]

LONI KAND.

Loni Kand, [The village is called Loni Kand to distinguish it from Loni on the Peninsula railway also called Loni Kalbhar in the same sub-division.] on the Poona-Ahmadnagar road about ten miles north-east of Poona, is a small village of 909 people with a travellers' bungalow.

In [Dr. Coats in Transactions Bombay Literary Society, III. 183-280. Dr. Coats' paper gives a very interesting account of an old Deccan village and describes in detail a village community, its institutions, and resources.] 1820 the township of Loni was described as having lands embracing a circumference of nearly nine miles comprising 3669 acres or about $5\frac{3}{4}$ square miles. Of these 1955 acres were arable and the rest common used as pasturage. The town had 568 people in 107 houses. The town was situated on a dry slope overlooking its garden and arable lands. From a distance it looked like a mass of crumbling clay walls broken by a few stunted trees, and here and there a building like a barn or stable covered with red tiles. The whole was surrounded by a mud wall five furlongs round, ten to twelve feet high and four or five feet thick at the base. The wall had two rude gates, ten to twelve feet high and as many broad, made of two pieces of thick teak planks joined by cross beams, let into an eye cut in the frame above and resting on a hollowed stone below which served as a hinge. Within, the town was comfortless, miserable and filthy. What seemed crumbling clay walls were the houses of the great body of the people built of sun-dried bricks of white chalky earth with terraced brick tops. Some were ruined and some had pieces of straw thatch thrown up against them to shelter poor people and cattle. The town had 107 inhabited dwellings and five public buildings, the *chavdi* or village office, three Hindu temples of Bhairav, Hanuman and Mahadev also used as rest-houses by travellers, and a ruined Musalman place of worship. The houses were built out of order as though for defence and had a general air of gloom and unsociableness. Narrow, dirty, and crooked lanes wound amongst them. The *chavdi* or office was thirty feet square with square gable ends and a tiled roof resting on a treble row of square wooden posts. It was used by travellers and Government messengers, and a corner of it was occupied by the Koli water-carrier. The temple of Bhairav was a tiled building open in front and poorly built. It contained images of Bhairav and his wife Jogeshvari and two or three pointed stones. All these were so covered with oil and redlead as to leave no trace of features. The image of Bhairav was in local repute for curing snake-bites and many people and cattle were said to have recovered. The god did not allow the *nim* tree, which is used against snake-bite, to grow within the village walls, as he himself took care of all snake-bitten patients. The building cost £12 10s. (Rs. 125). The temple of Hanuman twenty-six feet square had a flat roof terraced with white earth.

It had an open front and rested on rows of wooden posts. The image was placed against the back of the wall in a little niche facing the front. It was a rude imitation of a monkey covered with red- lead. The temple had been built by the villagers at a cost of £20 (Rs. 200). The temple of Mahadev (16' x 10') was built of hewn stone and lime and had a terraced roof. It was in two parts, a front to the east being a portico with three pointed arches, and a shrine in the back entered from the portico and containing a *ling* in a case. The temple was built in 1801 by a relation of the village headman or *patil*. In 1827 Captain Clunes notices Loni as belonging to the Dhamdhare family with eighty houses three shops and several wells. [Itinerary, 10.] In 1832 it is noticed as surrounded by a brick wall broken down in places. The inside of the village was dirty and wretched but there were no beggars. [Jacquemont Voyage dans l' Inde, III. 543.]

MADH.

Madh, a small village ten miles north of Junnar, with in 1881 a population of 899, has a weekly market on Saturday.

MAHALUNGE.

Maha'lunge, on the Sirur-Talegaon road, about eight miles south-west of Khed, with in 1881 a population of 1457, is an alienated village belonging to the Ingle family. A weekly market is held on Monday.

MALHARGAD.

Malha'rgad or Sonari fort, within the limits of Sonari village, about six miles north of Sasvad and three miles west of the Divte pass, is a small double-walled fort crowning a point on the Sinhgad range. About 700 feet above the plain on the Loni, and about 400 feet on the Sonari, side, the fort was about 700'yards round, and, though it had little strength either natural or artificial, its position at the head of the Divte pass was an anxiety and trouble to travellers and caravans. The outer wall of the fort, which followed the triangular form of the plateau, was thirteen feet high and six feet thick, the inner wall which was square with corner bastions of little strength being only six feet thick and about five feet high. The walls are pulled down in places and on the south are completely breached. Besides a main entrance at the north-east corner of the outer wall, the fort has several minor entrances at two corners. Inside are temples of Khandoba and Mahadev and ruins. The water-supply from a cistern and three wells inside the fort is scanty. The beautiful little Fan Palm fern, *Actiniopteris radiata*, grows in perfection in the crevices of the masonry and few finer specimens of the Maiden Hair fern can be found than in a part of the ruins. The fort was built about 1775 by Bhivrav Yashvant Panse and Krishnaji Madhavrav Panse, proprietors of Sonari village, and was called after the god Malhari because, when the foundations were being dug, blood oozed out of the ground. The blood was understood to be a mark of the displeasure of Khandoba or Malhari the Pance family god, and, after vows to build a shrine to the god and name the fort after him, the work went on and was finished without mishap. [The late Mr. G. H. Johns, C. S.]

MALSIRAS.

Malsiras, [The village is said to have got its name from the stony ground or *mal* in which it stands,] a small alienated village about fifteen miles north-east of Sasvad, with in 1881 a population of 899, has an old temple of Bhuleshvar Mahadev. The temple, which is built of stone and mortar, is sixty feet long and eight-sided and has some faded paintings. The hall or *sabhamandap* in front was built by one Bhargavram Svami. The temple is estimated to have cost about £10,000 (Rs. 1,00,000). [Mr. Norman's Report on Poona temples.] A yearly fair is held at the temple on the last day of *Shravan* or July-August when about 2000 people assemble.

MALTHAN.

Malthan, ten miles west of Sirur, with in 1881 a population of 2135, is a *dumala* or two-owned village belonging to the povar family. The village has a Mahadev temple and a Muhammadan tomb of Ismael Shah Pir. The temple is a fine building, about 200 years old, and lately restored with an additional hall or *sabhamandap* at the cost of the Povar family. In front of the temple, near the entrance, is a lamp-pillar or *dipmal* curvilinear in form and surmounted by a carved square capital. A small fair is held at the tomb on the dark fifth of *Chaitra* or March-April.

MANCHAR.

Manchar, on the right bank of the Ghod about twelve miles north of Khed, is a market town, with in 1881 a population of 4183. The town is surrounded by a wall and belonged to His Highness Holkar till 1868-69 when it became British by exchange. It has a post office and had a municipality from August 1863 to March 1875. A weekly market is held on Sunday. To the west of the town, beyond a watercourse, is a fine Hemadpanti reservoir about twenty-five yards square with two flights of steps leading to the water. Except the west wall which has a niche (3' X 2' 6") with carved side posts and sculptured foliage, the walls of the reservoir are plain. Within the niche is a much worn Devnagari inscription difficult to read. Manchar appears to have been a Musalman town of some importance, and has a small mosque at its south-west entrance. The mosque is entered by a fine single arch surmounted by a projecting and bracketed cornice with a small minaret at each of the four corners. In 1827 Captain Clunes notices it as belonging to Holkar with 200 houses, sixteen shops, 150 wells, and a weekly cattle market. [Itinerary, 18.]

MANKESHVAR.

Mankeshvar, a small village about eight miles north-west of Junnar, with in 1881 a population of 146, has, on a mound, the remains of what seems to be a fine Hemadpanti temple. The remains consist of two or three artistically sculptured pillars without base or capital, some fragments of capitals, and two large bulls or Nandis. Other fragments are probably buried in the mound. The temple is locally believed to have been destroyed by the Muhammadans and a Pir's tomb within a stone's throw to the south of the temple seems to confirm the local story.

MEDAD.

Medad or Amra'vati, on the left bank of the Karha, is a walled village, a mile north-west of Baramati, with in 1881 a population of 866. To the north, commanding the village, is a beautiful fort said to have had a gun as large as any at Bijapur. [Moor's Operations, 345.]

MORGAON.

Morgaon or Moreshvar, a large market town on the left bank of the Karha, about five miles south-west of Supa, with in 1881 a population of 1632, has a large handsome temple of Ganpati. Here Moroba Gosavi, the founder of the Dev family of Chinchvad, used to Worship his favourite deity until its transfer to Chinchvad. [See above Chinchvad pp. 125-127.] The floor stones of the temple are arranged in the form of a large tortoise.

Near the temple is a rest-house an ornamented square building with a dome. The rest-house was built in 1792 and is of unusually fine Workmanship. A yearly fair is held at the Ganpati temple on *Ganeshchaturthi* the bright fourth of *Bhadrapad* or August-September, and lasts till the tenth of the bright half of *Ashvin* or September-October. A weekly market is held on Sunday. In 1792 Captain Moor describes Morgaon as a large town with a fairly good market, a handsome temple, and a rest-house which was then building.

MULSHI BUDRUKH

Mulshi Budruk, a small village about ten miles south-west of Paud, with in 1881 a population of 530, has a weekly market on Sunday.

MUNDHAVE.

Mundhave village, about five miles north-east of Poona, had from 1840 to 1842 a nursery garden where Messrs. Sundt and Webbe grew excellent coffee. [See Part II. 77]

NANE.

Na'ne in Maval, about two miles north of Khadkala, with in 1881 a population of 727, has a weekly market on Saturday. In a revenue statement of about 1790 Nane Maval appears as the headquarters of *apargana* in the Junnar *sarkar* with a revenue of £1963 (Rs. 19,630). [Waring's Marathas, 240.]

NANOLI.

Na'noli village, three miles north-east of Talegaon Dabhade, has some old caves in a hill scarp a mile to the north. A steep climb three quarters up the hill leads to the base of a high scarp facing south-west. Skirting this scarp a cistern and a cell are passed, and beyond them a flight of rudely cut steps leads to a square flat-roofed cave (18'x 18'x 7')

now used as a temple dedicated to the goddess Phirangabai. In the south wall of the cave is a small cell. Beyond the cave the scarp is hollowed into two small cells.

NARAYANGAON.

Na'ra'yangaon on the Mina, nine miles south-east of Junnar, with in 1872 a population of 3915 and in 1881 of 3447, is a large market town with a post office and a public works bungalow. The weekly market is held on Saturday. The Poona-Nasik road affords good communication to the north and east and a well made local fund road joins the town with Junnar eight miles to the north-west. The town is entered by two main gates, the Junnar gate on the west and the Poona gate on the east. Narayangaon had a municipality from 1861 to 1874, Close outside the Junnar gate is an unfinished mosque with two fine pillars in front and near the mosque is the tomb of a Musalman saint. Further to the west towards Junnar a temple of Vithoba stands picturesquely on the left among fine trees near the Mina. On a hill about a mile to the south of Narayangaon is the tomb of Ganj Pir where a yearly fair attended by one to two thousand people is held on the bright ninth of *Chaitra* or March-April.

Fort.

About three miles east of the town on a detached hill which on the north, south, and west rises sharp from the plain is the dismantled fort of Narayangad (2916). The chief strength of the fort lay in its great natural defences. Its artificial fortifications, which were never very strong, were almost completely dismantled in 1820. Ruins of its north wall and of four of its bastions remain. Inside the fort on the extreme hill top is a small temple of Hatsabai. The water-supply is abundant from two cisterns or *tankis* fed by springs and several reservoirs or *hauds*. At one of the cisterns the god Narayan is said to have shewn himself to his devotees about 1830. For two or three years after the manifestation, a fair, attended by thousands of people, was held every Monday in honour of the god. The hill has some other ruins, especially a stone doorway bearing on its lintel a figure of Ganpati and two attendant tigers. The fortress is said to have been built by the first Peshwa Balaji Vishvanath (1714-1720) and given in *saranjam* or service-grant to Sayaji Povar. In the last Maratha war of 1818 Narayangad is said to have surrendered to the English after only one shell had reached the inside of the fort. [The late Mr. G. H. Johns, C. S.] In 1827 Captain Clunes notices Narayangaon as a market town or *kasba* with 700 houses, twenty shops, forty houses of dyers, and 200 wells. [Itinerary, 18.]

NARSINGPUR.

Narsingpur, at the meeting of the Bhima and the Nira, in the extreme south-east of the Poona district, about twelve miles south-east of Indapur, with in 1881 a population of 1004, has a temple of Shri Lakshmi Narsinh with flights of steps leading to the river bed. [Mr. Norman's Report on Poona temples. Dr. Burgess'Lists, 81.] The temple was built by the chief of Vinchur in Nasik about 150 years ago at a cost of about £45,000 (Rs. 4,50,000). The temple is eight-sided, built of black stone, with a gilt apex seventy feet high. Most of the steps are as old as the temple and a ruined part on the south was rebuilt

by Vaman Kelkar a Deshmukh of Aurangabad at a cost of about £1100 (Rs. 11,000). A yearly fair, attended by about 4000 people and lasting two days, is held in honour of the god on the bright fourteenth of *Vaishakh* or April-May.

NAVLAKH UMBRE.

Navlakh Umbre in Maval is an old village about ten miles north-east of Khadkala. The village lies at the source of the Sud a feeder of the Indrayani, and has some interesting Hindu and Musalman remains. The hills round the village enclose it like an amphitheatre. The Hindu remains are a temple of Bahiroba Naukhandi in the hill range and a canopied tomb locally known as Barakhamb or the twelve-pillared. The tomb lies to the north of the village on the left bank of the Sud. The tomb looks like a bandstand and consists of a plinth 23' 3" square raised four feet from the ground and a dome resting on twelve octagonal pillars, arranged in a circle in the plinth. The pillars are 7'5" high. Under the capitals are carvings resembling spear-heads but they slightly differ in form on the different pillars. They are said to represent the leaf of the *suru* or cypress tree. The plinth, pillars, and twelve-sided entablature are of cut stone, and the vaulted dome, which is of burnt brick plastered over, shows signs of decay on the outside. The dome is surmounted by a central ornament with a small piece of wood called *kalas*. The tomb is said to have been built over the remains of his priest or *guru* by a Jangam Vani of Umbre about 200 years ago. On the plinth, under a boss hanging from the middle of the dome, is a *ling* without a case. On the north of the tomb is an unreadable inscription. To the south of the village, facing a pond, is a mosque, a square and very massive building ornamented with graceful tracery and said to be about 500 years old. It has a well preserved inscription said to contain the builder's name and the date. The gateway of the Moghal office or *gadhi* is still preserved, [Mr. H. E. Winter, C. S]

Legend.

According to a local story the village was founded about 700 years ago. The Kazi of Umbre has grants one of which is said to be dated as far back as 634 Hijri or about 1235. The present Kazi is an old man named Sayadu Dhondibhai. The traditional explanation of the name Navlakh or nine *lakhs* is that, during the *Divali* holidays in October-November, a daughter of one of the Moghal officers of Umbre asked her father for a present or *ovalni* [The *ovalni* ceremony is performed by Hindu sisters to their brothers on the second day after *Divali*, called the Brother's Second or *bhaubij*. It consists of the sister waving a light across the face of her brother and of the brother making her a present.] and he ordered her the payment of a day's receipts at the turnspike on the bridle path of Umbre. The toll is said to have been one *tankha* ($\frac{1}{2}$ a.) on animals and head-loads passing to Poona by the Kuser or Khandala passes. The day's receipts are said to have amounted to nine hundred thousand or *nav lakh* of *tankhas* or about £2800 (Rs. 28,000) and this event is said to have given the name of Navlakh to the village. [Lady Falkland's version of the story (Chow Chow, I. 238-239) is slightly different. According to her the present was asked by a Musalman queen from her husband. The king was greedy but he could not refuse his wife's request. But he was sorry the queen asked the income of so poor a hill toll as Umbre, which hardly paid, he thought, the establishment, when she might have

asked the toll of a rich place like Lahor or Surat. His surprise was great when he learnt that a day's receipt amounted to nine *lakhs of tankhas*.] Umbre is probably the Russian traveller. Nikitin's (1470) Oomri on his way from Cheul to Junnar. From Cheul Nikitin went in eight days to Pilee in the Indian mountains, which is perhaps Pimpri at the head of the Pimpri pass; thence in ten days, Nikitin went to the "Indian" that is Deccan or above Ghat town of Oomri, and from Oomri he went in six days, probably by the old Talegaon and Khed road, about sixty miles to Junnar. [Major's India in XV Century; Nikitin, 9. Nikitin's route is puzzling. It was formerly supposed to have been by Pulu Sonale at the foot of the Nana pass but the position of Pulu Sonale does not agree with the sixteen days between it and Junnar. To explain Nikitin's eight days to the Pimpri pass it may be supposed that he went by Ramraj, Rohe, Ghosala, Tala, Indapur, Nizampur, and Umbardi to Pimpri. Mr. W. F. Sinclair, C. S. suggests that the Nagothna route is more likely. He would place Pilee at Pali fort in the Bhor state.]

[NIMBDARI.](#)

Nimbdari, a small village of 655 people, six miles south of Junnar, has a shrine of Renukadevi with a yearly fair on the full-moon of *Chaitra* or March-April attended by about 3000 pilgrims.

[NIMGAON.](#)

Nimgaon, an alienated village on the right bank of the Bhima about six miles south-east of Khed, had in 1881 a population of 1121. On a knoll to the north is a temple of Khandoba which was built by Govindrav Gaikvad about the close of the eighteenth century. A yearly fair, attended by about 5000 people, is held at the temple on the full-moon of *Chaitra* or March-April. The temple enjoys twenty-two acres of rent-free land.

[NIMGAON KETKI.](#)

Nimgaon Ketki, eight miles south-west of Indapur, with in 1881 a population of 2408, has a weekly market on Saturday.

[NIRVANGNI.](#)

Nirvangni on the Nira, about twelve miles south-west of Indapur, has a temple of Mahadev with a large bull or Nandi. The bull stands under a canopy before the shrine of Mahadev which is to the west. [The space between the bull canopy and the Mahadev shrine has been recently closed by the villagers with masonry.] The shrine is half covered with earth and stones forming a plinth. On the left the bull has a slight scar. The horns, says the story, were knocked off by the Musalmans who were going to break the bull but blood gushed out and they refrained. On a stone, over the plain doorway of the shrine, is an inscription which cannot be made out. All pilgrims to Shingnapur in Satara about thirty miles south of Nirvangni must visit the Nirvangni bull and Mahadev before going to Shingnapur. The legend is that when Mahadev was at Nirvangni the bull strayed into a Mali's garden. The Mali pursued the bull and wounded it on the left side with a sickle or

khurpe and the scar of this wound is still seen on the bull. Mahadev and the bull then went to Shingnapur but the bull came back to the Mali's garden. Seeing that the bull liked Nirvangni Mahadev arranged that he should live at Shingnapur and the bull at Nirvangni, and that every pilgrim to Shingnapur should first visit and pay obeisance to the bull at Nirvangni. [Mr. J. G. Moore, C. S.]

OJHAR.

Ojha'r or **Wojha'r**, on the left bank of the Kukdi, is a small alienated village six miles south-east of Junnar, with in 1881 a population of 674. Ojhar was the scene of one of the eight incarnations of Ganpati in whose honour a temple is built to the west of the village. [The seven others are at Junnar Ranjangaon and Theur in Poona, at Pali in the pant Sachiv's territory, at Madh in Kolaba, and at Sidhtek in Ahmadnagar.] The temple, which is about a hundred years old, lies in an enclosure entered by a fine gateway. The sides of the gateway have sculptured doorkeepers, and a row of four musicians in bas relief adorns the lintel. All the figures are brightly painted. Within the enclosure are two fine lamp-pillars in front of a fine corridor of seven cusped arches used as a rest-house. The temple is entered by three doors with sculptured side posts and lintels. The east entrance is the chief and bears, over the lintel, a relief figure of Ganpati with parrots and monkeys disporting in trees. A small dome flanked by four minarets surmounts the hall, and over the shrine is a spire adorned with the usual rows of figure-filled niches. The village revenues are alienated to the temple which is managed by the Inamdar. In 1827 Captain dunes notices it as an alienated village with a hundred houses and one shop. [Itinerary, 18.]

OTUR.

Otur, north latitude 19°16' and east longitude 74° 3', on the left bank of the Kushmavati [The Kushmavati rises about three miles above Otur from a deep gorge in the Sahyadris under the mountain of Bhambori. It cuts a deep and winding course through the black soil of Otur plain and flows four miles lower into the Kukdi near the Botanical gardens at Hivre Budrukh. The river is unfordable during July and August and almost isolates Otur.] or Mandvi a feeder of the Kukdi, ten miles north-east of Junnar, is a large and rich market town, with in 1872 a population of 6291 and in 1881 of 5780. Otur commands the eastern mouth of the Madmhora valley ending westward in the Malsej pass. About two miles west of the town extends the mountain range which, beginning from the fort of Harishchandragad (4691) at the head of the Malsej pass, forms the northern wall of that valley and is the boundary between the Poona and Ahmadnagar districts at this point stretching far east into the Deccan. The highest points in this range are Gidani, Bhambori, and Chauria, the last within the limits of Otur and about 3700 feet above the sea. Three miles from Otur the Brahmanvada pass, fit for laden cattle, leads to the south-west corner of Ahmadnagar, and twelve miles to the east is the Ane pass, on the Poona-Nasik road, fit for wheels.

Otur has three main entrances, the Rohokad Ves or north gateway, the Nagar Ves or east gateway, and the Junnar Ves or west gateway. Two of these the Rohokad and Nagar are

well preserved. The town has a post office and a Collector's bungalow not far from the northern entrance, a fort, and two temples on the river bank. The fort, near the Junnar gate, was built in the last century to guard against Bhil raids. It was described in 1842 as a small ruined *gadhi* built on rising ground. The fortifications are fast falling into decay. Inside was a large mansion or *vada* able to hold about fifty people. The water-supply was scarce and other supplies not available. The two temples are of Keshav Chaitanya the teacher of the famous Vani saint Tukaram and of Kapardikeshvar Mahadev. Chaitanya's temple is built over the tomb or *samadhi* of that saint. A yearly fair, attended by about two thousand people, is held at Kapardikeshvar temple on the last Monday of *Shravan* or July-August. The temple enjoys a Government cash grant of 4 10s. (Rs. 45) and some rent-free land. Otur had a municipality which was abolished in 1874 at the request of the people. In 1827 Captain Clunes notices it as a market town or *kasba* with 2500 houses and many gardens. [Itinerary, 18.]

PABAL.

Pa'bal, twenty miles west of Sirur, is a market town with in 19 a population of 3565 and in 1881 of 1977. Pabal was the head-quarters of a sub-division till 1867, when, on its transfer from Ahmadnagar to Poona, Sirur became the head-quarters of the newly formed sub-division. A weekly market is held on Friday Pabal has a post office, a Hemadpanti temple, and a Musalman tomb. The Hemadpanti temple of Nageshvar, to the west of the town, is said to have been built by one Kanhu Rajpatak. The hall or *mandap* is divided into three small aisles by two rows of three pillars each, the outermost pillars being slightly sculptured. In front, to the of the temple, is a small Hemadpanti pond said to have been built by a dancing girl a favourite of Kanhu's. Flights of steps lead to the water, and in the side walls are small niches with sculptured side posts. To the north-east of the temple a fine one-stone pillar on a lofty pedestal and supports a huge capital. The tomb, to which a mosque is attached, is in an enclosure to the north of the town The tomb belongs to Mastani, the favourite Musalman mistress of the second Peshwa Bajirav Balaji (1721-1740). Mastani is said to have been captured by Chimnaji Apa in Upper India and presented to Bajirav. She died at the Shanvar palace in Poona, one of whose gates is still called after her, and was buried at Pabal which, with the neighbouring villages of Kendur and Loni, was granted to her.

PADLI.

Pa'dli village, about two miles north-west of Junnar, with in 1881 a population of 258, has a temple of Madhusudan or Vishnu, where a yearly fair, attended by about 3000 people, is held on the dark eleventh of *Ashadh* or June-July. The temple enjoys a yearly Government cash grant of £5 16s. (Rs. 58) and about fifty-six acres of rent-free land assessed at £1 9s. (Rs. 14 ½).

PALASDEV

Palasdev, [A local story, perhaps a play on the name of the village, is that about 200 years ago cattle used to graze on the site of the present village. Some cows were found

dropping their milk over a *palas* tree. The cowherds cut the tree and found in the trunk a sand *ling* over which they built the temple and gave it the name of Palasdev.] formerly called Ratnapur, is a large market village on the Bhima about fifteen miles north-west of Indapur, within 1881 a population of 1431. A weekly market is held on Monday. Palasdev has a temple of Shiv said to have been built by cowherds about 1680. The temple is twenty-eight feet high built of stone for eight feet from the ground and the rest of brick. The shrine is of stone and the spire of stone and brick with a coating of fine lime. An outer wall was built round the temple by one Baburav Jagirdar of Baramati.

PARGAON

Pa'rgaon, a large village eleven miles north-west of Patas, with in 1881 a population of 2285, has an irrigation bungalow and a temple of Tukai Devi said to have been built by the Takavne family. The image was brought from Tuljapur in the Nizam's territories. A yearly fair is held at the temple on the full-moon of *Chaitra* or March-April.

PARUNDE.

Pa'runde, a small village six miles south-west of Junnar, with in 1881 a population of 1007, has an old ruined temple of Shri Brahmanath Dev. A yearly fair, attended by about 2000 pilgrims, is held on the dark fourteenth of *Magh* or February-March. The temple enjoys a Government cash grant of about £3 (Rs. 30).

PASHAN.

Pa'sha'n is a small village of 913 people four miles north-west of Poona, two miles west of Ganeshkhind and about a mile from the Bombay road. The village is pleasantly placed in a beautiful grove on a feeder of the Mula river. The common story of the cowherd watching his milk-less cow and finding it feeding a serpent who lived in an ant-hill is told of Pashan. The cowherd dug the ant-hill, and finding five *lings*, built a shrine, called it Someshvar, and became its ministrant. The village of Pashan was built near the shrine and a temple was built by the mother of Shahu (1708-1749). The temple, which is enclosed by a high wall, is a heavy sombre-looking square structure built of stone with a brick roof. Two verandas and halls or *mandaps* were added to the main building by one Shivram Bhau about 1780 and the building now measures 36' x 17' X 31'. In front is a bull or Nandi and a lamp-pillar or *dipmal*. A flight of steps leads from the temple to the river bed where is a square bathing place called *chakratirth* with steps on four sides. In a year of threatened drought the fourth Peshwa Madhavrav (1761-1772) engaged Brahmans to offer prayers at the temple, and when their prayers were heard, he made a grant of a sum of £330 (Rs. 3300) which is still continued. The Brahmans, who are chosen in batches every eleventh day in Poona, besides board and lodging receive each £16 4s. (Rs. 162). They offer prayers from morning to eleven and again in the afternoon. The permanent staff consists of a cook, a clerk, a storekeeper, a Ramoshi, a watchman, and a Kamathi. A yearly fair is held on *Mahashivratra* the Great; Night of Shiv in *Magh* or February-March. The funds are managed by a committee. Pashan has a reservoir which

supplies Government House, Ganeshkhind, and Kirkee with a plentiful supply of good water.

PATAS.

Pa'tas in Bhimthadi on the Poona-Sholapur road, eight miles north-east of Supe and forty miles east of Poona, with in 1872 a population of 2552 and in 1881 of 1692, is a large market village. Besides a railway station two miles to the north, a sub-judge's court, and a post office, Patas has a temple of Nageshvar Mahadev, a rest-house, a mosque, and a weekly market on Thursday. The 1880 railway returns showed 15,067 passengers and 453 tons of goods.

The Nageshvar temple, built of cut and polished stone, consists of a shrine and an audience hall or *sabhamandap* with a veranda on both sides. It is said to have been built about 200 years ago. Patas has two ponds one of which was built as a famine relief work in-1877. But the ponds do not always fill as the rainfall here is precarious.

PAUD.

Paud, on the Mula, about twenty miles west of Poona, is the head-quarters of the Mulshi petty division in Haveli, with in 1881 a population of 1566. Besides the petty divisional revenue and police offices, Paud has a post office and a market on Saturday.

PETH.

Peth, on the Vel, a feeder of the Bhima, four miles north of Khed, is an alienated village with in 1881 a population of 1495 and a post office.

PIMPALVANDI.

Pimpalvandi, with in 1881 a population of 4227, is a large village on the Kukdi, about ten miles south-east of Junnar. The village has a post office and a weekly market on Thursday.

POONA.

Poona [A great part of the Poona city account is contributed by Rav Saheb Narso Ramchandra Godbole, Secretary Poona City Municipality.] City and Cantonment, north latitude 18° 30' and east longitude 73° 53', 119 miles south-east of Bombay and 1850 feet above the sea, cover an area of about 6114 acres, in 1881 had a population of 129,751, and in 1883 a municipal revenue of £23,304 (Rs. 2,33,040).

On the right bank of the Mutha river, in a slight hollow, the city and cantonment are bounded on the west by the Mutha, on the north by the joint Mula and Mutha, on the east by their feeder the Bahiroba, and on the south-east and south by the spurs and uplands that rise to the northern slopes of the Sinhgad-Bhuleshvar hills. Beyond the tree-fringed

line of the Mutha-Mula, to the north with a gentle rise and to the east with a gentle fall, stretches a dry plain without trees and with scanty tillage, broken by scattered blocks of bare level-crested hills, the outlying eastern fragments of the range that separates the Indrayani and Mutha-Mula valleys. On other sides, except up the Mutha valley to the south-west, the city and cantonment are surrounded by uplands and hills. On the north-west is the soilless Ganeshkhind upland, and on the west, from the rocky slopes of the Chatarsing or Bhamburda hills, bare waving ranges rise to the central peak of Bhanbava. To the south rises the low but sharp-cut and picturesque temple-crowned top of Parvati, and behind Parvati the broken outline of the Sinhgad-Bhuleshvar range.

Geology.

In and round the city and cantonment the underlying rock is basalt. On the neighbouring hills an amygdaloid trap crops out or comes close to the surface. The higher parts of the cantonment have a surface layer of crumbled trap or *murum*, which in the lower parts passes into a whitish loam, and on stream banks and near the Mutha-Mula turns to a deep black cotton soil. To the west and north-west of Poona, on the Ganeshkhind uplands, in the Government House grounds, and further to the north, where black soil and rock mix at the meetings of the Mula with small local feeders, numbers of pebbles and crystals are found. The chief of these are white chalcedonies in large quantities, red carnelians, bloodstone, moss agate, jasper, and rock crystal. [Mr. T. M. Filgate. The richness of the neighbourhood of Poona in agates and pebbles is noticed by Lord Valentia in 1803. (Travels, II. 103). The abundance of agates and crystals suggests, as is noted below under History, that Ptolemy's (A. D. 150) 'Punnata in which are beryls, refers to the Deccan Poona, perhaps to distinguish it' from punata without beryls in Maisur. [Compare Mr. Rice in Indian Antiquary, XI. 9]. Beryl the Greek berylos, though now technically used of only one emerald-like stone, seems originally to have been a general term. It apparently, is the Arab *bilauri* crystal.]

Aspect.

The land between the Mutha-Mula and the Sinhgad hills is a wooded plain, rising slightly to the south and east, the surface unbroken except near the river and along four of its smaller feeders which cross the plain from south to north. The area covered by the city and cantonment includes three belts, a western a central and an eastern. In the west is the city, with, in the heart of it, thick-set streets and lanes, and on the north and south fringes of rich garden land. The central belt, to the east of the city with poor soil and broad tree-lined streets, is, except the thickly-peopled Sadar Bazar in the south, parcelled among detached one-storeyed European dwellings whose sameness is relieved by scattered public buildings, the Council Hall (52). [The number in brackets after this and other names is the serial number of the object in the lists of Objects of which details are given below,] the Sassoon Hospital (101), the Synagogue (113), St. Mary's and St. Paul's churches (109 and 111), the Arsenal Water Tower, and the Military Accounts Office (84). The eastern belt, with a gentle fall to the Bahiroba stream, except some garden-land in the north-east, is a bare rocky plain crossed by roads lined with young trees, and skirted by blocks of one or two-storeyed stone barracks and rows of detached officers' dwellings.

The River.

One [Mr, R. G. Oxenham, Principal Deccan College.] of the chief beauties of Poona is its river, the Mutha-Mula, formed by the meeting, about three quarters of a mile west of the railway station, of the Mutha from the south-west and the Mula from the north-west. About a mile and a quarter north-east of the Railway Station (97), at the Bund Gardens (47), about 200 yards above the FitzGerald bridge (63), the Mutha-Mula is crossed by a stone weir or Bund built in 1850 by Sir Jamsetji Jijibhai at a cost of £25,749 18s. (Rs. 2,57,499). Except when floods dash several feet deep over the weir and fill the lower bed from bank to bank, the water, even in the rainy months, falls from the weir shallow and clear only partly covering the rocks of the lower river-bed. During the rainy months, to clear silt and let the muddy flood waters pass, the side sluices are left partly open. The sluices are generally closed in November; in average seasons the flow of water is nearly over by the end of December, and in the river below the weir lines of sedge fringed pools lie in a broad bed rough with ridges and boulders of trap. Above the weir, through the cold and hot months of all ordinary seasons, the river is navigable for pleasure boats as far as the old masonry bridge known as Holkar's Bridge (75), a distance of about three and three quarter miles. About one and a half miles of this distance, from the weir to the meeting of the Mutha and Mula, is nearly south-west. Above the meeting the Mula curves to the north and north-east as far as Holkar's bridge. At about three quarters of a mile below Holkar's bridge, or almost three miles above the weir, on the right or eastern bank of the river is Rosherville the meeting place for the Boat Club. Above Holkar's bridge are some rocky barriers, but during freshes boats can go to the Powder Works dam, two miles above Holkar's bridge. Above the Powder Works dam another navigable reach stretches about three miles as far as the village of Dapuri above the Peninsula railway bridge (96).

From the FitzGerald bridge looking west is one of the prettiest views in Poona. On the right, about 150 yards from, the river, a rocky flat-topped hill rises about 150 feet above the bank and stretches about 300 yards west gradually falling to a small river-bank tomb. On the left are the trees and flowers of the Bund garden, the higher tree-tops half hiding the distant broken line of the Sinhgad-Bhuleshvar hills. In front, from the edge of the dam, between low tree-fringed banks, the river, about 200 yards wide, stretches west about half a mile to where it is divided by a long low woody island. Beyond the island, as it turns south-west to the meeting of the rivers, the water passes out of sight in the green Kirkee plain behind which the low rounded blocks of the Ganesh khind and Bhamburda hills lead to the central peak of Bhanbava.

About 1700 feet above the FitzGerald bridge, hid in trees on the south or right bank of the river, is the Boat House of the Poona Boat Club, well supplied with the ordinary Thames-built racing and pleasure boats. Above the boat-house, with a nearly uniform breadth of 200 yards, the river stretches a little south of west about three quarters of a mile to where a large and a small woody island divide the stream. On either side of the large island is a channel, a main or western channel always open for boats, and a narrow eastern passage open only in floods. Above the island the river gradually widens, till, a little below the meeting or *sangam* of the Mutha from the south-west and the Mula from the north-west,

it is 430 yards across, that is 140 yards broader than the Thames at London Bridge. At this point a remarkable he gives back clearly spoken words three times or even more A little below the meeting of the Mutha and the Mula is perhaps the most picturesque spot in the three miles boating course. In the foreground are the woody islands and the mouth of the Mutha spanned by the Wellesley and railway bridges, its left bank crowned by the lofty trees which surround the Judge's house and its right bank ending in a cluster of temples joined to the water by flights of steps. From the middle distance rises the bold temple-topped rock of Parvati and behind Parvati stretches the level scarp of Sinhgad. Above the Sangam a rough dam, 500 yards beyond the railway bridge, makes the Mutha impassable to boats. But the Mula, with an average breadth of about fifty yards, between low banks, the left *babhul* and bamboo fringed, the right studded with houses of which the chief is Sir A. Sassoon's Garden Reach, winds, passable for boats, a mile and a half higher to a resting place named Rosherville, where, on the right or eastern bank, a landing stage is moored and seats and refreshments are provided. The boating course from the boat-house to Rosherville is about a furlong short of three miles. In the yearly Regatta the racing-course is from Rosherville down to a point opposite to Garden Reach, a distance of one mile. The racing course, with the exception of one slight bend about a third of a mile from the start, is straight.

Roads.

In the city most of the roads, though smooth and clean, are narrow crowded and occasionally broken by sharp turns, but otherwise Poona is well supplied with broad smooth roads generally lined and in places overshadowed with trees. Along these roads the three favourite drives are, to the west and north, to the east, and to the south and south-west. From the railway station as a centre the chief drive to the west is by the Sassoon Hospital (101), across the Mutha by the Wellesley Bridge (117), past the Science College (102), and along the Kirkee road, returning across the Mula by Holkar's Bridge (75) and the Deccan College (53), crossing the Mutha-Mula by the FitzGerald Bridge (63) and back past the Bund Gardens, a distance of about seven miles and three quarters. This drive can be varied and lengthened by leaving the Kirkee road a little beyond the Science College, passing along the Bhamburda road and round the Ganesh-khind grounds, and back through the Kirkee cantonment to Holkar's bridge. The whole length of this outer round is about eleven and a half miles. The drive to the east is through the Civil lines past the Club (49) and St. Mary's Church (109) through the Vanavdi lines, round the race-course, through the Ghorpadi lines, and back by the Bund gardens (47). The length of this round is about seven and a quarter miles. The south drive is through the Civil lines and the Sadar Bazar to the west, past the lake and hill of Parvati (90), to the north-west over a rather rough river-bed to the Lakdi bridge, and from the Lakdi bridge back by Bhamburda, the Wellesley Bridge, and the Sassoon Hospital. This round is about ten and a half miles.

City.

For description the city and cantonment of Poona come most conveniently under three parts, a western a central and an eastern, poona City, the western division, has spread so

far eastward, and has been so nearly met by the outlying streets of the Sadar Bazar and of the Civil lines, that, in passing from one to the other it is not easy to say where the cantonment and civil lines end and the city, begins. The eastern limit of the city may be fixed at the left bank of the Manik stream, which, after a winding north-west course, falls into the Mutha about 300 yards above its meeting with the Mula. From the left bank of this stream the city of Poona stretches about a mile and three quarters west along the right bank of the Mutha river. The city varies greatly in breadth. In the east the part covered with houses is not much more than a mile across. From this it gradually widens to about a mile and three quarters, and then narrows in triangular shape, the tip of the triangle lying close to the bridge known as the Lakdi Bridge about one and a half miles above the meeting of the Mutha and Mula. For municipal and other purpose this city area is divided into eighteen wards or *peths*. These may be roughly grouped into three divisions, the eastern the central and the western. The eastern division, most of which dates since the beginning of British rule, lies between the left bank of the small winding Manik stream and the right bank of the larger less irregular Nagjhari, which, after a westerly course, joins the Manik stream as it falls into the Mutha. West of the Nagjhari the city proper, the Poona of Muhammadan (1290-1636) and early Maratha (1636-1686) days, with its centre and original starting point at the younger Shaikh Salla's mosque (31), once the temple of Puneshvar about 1000 yards above the meeting of the Mutha and Mula, stretches about a mile along the river bank and runs inland about one and a half miles. West of the city proper the third division, stretching along the river bank about 800 yards and gradually narrowing to a point near the Lakdi bridge, consists of suburbs founded in the later days of the Peshwa rule (1760-1818).

As it is built according to no regular plan, and has only two main streets and many narrow broken and winding lanes, Poona City is difficult to describe. Most of its roads, though well kept and clean, are narrow with side-gutters either open or covered with stone slabs and with rows of houses generally built close to the roadside. Some of the houses are one-storeyed, little better than sheds, with long sloping tiled roofs and low plain front walls of unbaked brick coated with white earth. Other houses are two-storeyed, the under storey with a heavy tile-covered eave resting on plain square wooden pillars the upper storey plain, with perhaps a row of arched wooden windows closed on the outside with plain square shutters and slightly shaded by a shallow eave. In other houses the ground-floor stands back and beams of wood support an overhanging upper storey with a more or less ornamental balcony and a heavy upper eave. Every now and then the line of commoner dwellings is broken by some large building, either a new house two or three storeys high with bright wood work and walls of burnt brick picked out with cement, or the long blank walls of one of the old mansions. The overhanging irregular wood work, the sharp turns and windings, and the variety in size and style of houses, make some of the streets picturesque in places, and trees planted at the roadsides, or, oftener, hanging from some garden or temple enclosure, give many of the streets a certain greenness and shade. In the western wards the roads are broader, and both there and in the south-west they are bordered by long lines of garden Walls. Most of the houses are poor, but the lanes are redeemed from ugliness by occasional temples, houses with picturesque overhanging balconies, and magnificent *nim*, *pipal*, and banian trees growing in raised circular pavements. The lanes are quiet, with few people and little cart or

carriage traffic, with here and there a grain or a sweetmeat shop, and wells with groups of water-drawers. The main streets are called after the days of the week. Only two of them, Aditvar and Shanvar, differ much from the lanes in breadth or in the style of their buildings. Aditvar or Sunday Street and Shanvar or Saturday Street the main lines of traffic, vary from twenty to thirty feet in breadth and have paved footpaths running inside of a covered gutter. The houses vary greatly in size and appearance. A few are one-storeyed little more than huts, the greater number are either two or three storeys high, and some are large four-storeyed buildings. The style of building is extremely varied. The middle-class and commonest house stands on a well built plinth of cut-stone three to four feet high, with a row of square plain wooden pillars along the edge of the plinth, and, resting on the pillars, a deep heavy eave roofed with rough flat Deccan tiles, and a plain wooden plans running along the front of the eave. In these houses the face of the upper storey is sometimes nearly plain with a beam that only very slightly stands out from the wall and with a very shallow eave. In others the wood work stands further from the wall, is more or less richly carved, and is shaded by a deep upper eave. Some have a balcony with a light balustrade two or three feet high, and a slight shade overhead supported by slanting poles. On both sides of the street the ground-floors are occupied by shops with cloth-blinds hanging about halfway down from the edge of the eaves. The shops are well stored with grain and pulse, with sweetmeats, cloth, stationery, ornaments, and vessels of brass copper and iron. The streets are crowded with carts and carriages. The people are busy, bustling, Well fed, and well dressed; and the number of new houses in almost every quarter of the town, some of them, large and striking even alongside of the old mansions and palaces, gives the city an air of much prosperity. On the whole the city is well shaded. Even in the busiest parts are richly wooded gardens with temples and cocoa-palms and black tapering cypress trees, and along the south-west and south are large areas of enclosed orchards and gardens. The roofs of several of its high mansions command good general views of the city. [Among the best view-points are the pavilions on the roofs of the Purandhare's (27) and Kibe or Mankeshvar mansions in Budhwar ward, and the Bohoras' Jamatkhana (8) in Aditvar ward.] The foreground is of high-pitched house-roofs varying much in size and height but all brown with rough flat Deccan tiles. Here and there parallel lines of roofs mark a street or a lane, but in most places the roofs rise sometimes close together, sometimes widely apart and almost always without apparent system or plan. Among them, at considerable distances, stand out the high roofs of old mansions, crowned with small flat-topped or tile-covered canopies, and the lofty gable ends of new dwellings with white cement and fresh brick and mortar walls. Breaking and relieving the lines of roofs, over the whole city and especially among the rich garden lands to the south and south-west, rise single trees and groups of *pipals*, *banians*, *nims*, and tamarinds, almost all large and well grown, and many lofty and far-spreading. There are almost no mosques or domed tombs. But on all sides, from among the trees and house-roofs, stand out the white graceful spires of Hindu temples.

Under the Musalmans (1290-1636) the military portion of the town or *kasba* was enclosed by a wall built, like other Deccan village walls, of mud and bricks on stone and mud foundations. The wall was called the Pandhri or White wall and is now called the Juna Kot or Old Fort (24). It stretched from the younger to the elder Shaik Salla's tomb along the bank of the Mutha river, leaving both the mosques outside of it. From the elder

Shaikh Salla's tomb the wall turned south to the north-east corner of the Mandai or Market ground, where was a gate called the Konkan Darvaja or Konkan Gate. The stone steps which led to this gate remain. From the Mandai the wall passed east along the backs of houses on the north side of Dikshit and Pethe streets to Pethe's cistern. It then turned north and continued almost straight to the younger Shaikh Salla's tomb. Midway between Pethe's cistern and the younger Shaikh Salla's tomb was another gate facing east called the Nagar Darvaja or Ahmadnagar gate. The site of the Nagar gate can still be traced, exactly opposite Lakdi street. The Maruti which belonged to this gate remains. The wall was in the form of an irregular rectangle, the sides being north 280, south 260, west 130, and east 200 yards. It had several bastions and loopholed parapets. Two small gateways which led to the river on the north have only lately disappeared. Flights of steps leading to the river from these gates remain and are known as Purandhare's Steps and Sapindya Mahadev's or the Twelfth Day Funeral God's Steps. On the south, to the east of Moghe's mansion, was another small gate but neither its site nor its name is known. The remains of the wall may be traced all along its course, and in many places the foundations and plinth are unharmed. The wall, which was about fourteen feet high and four feet broad, rested on a plinth of stone and mud sixteen feet high and six feet broad. It was built about 550 years ago by one Barya Jamadar, an Arab, who is said to have been the first commandant of Poona. [Mr. N. V. Joshi's Poona, Ancient and Modern (1868), 5.] The army and its followers with a few Muhammadan villagers were alone allowed to live within the wall. The traders, Brahmans, Hindu cultivators, and others, with the village officers lived outside of the wall to the east. In 1755 the third Peshwa Balaji Bajirav (1740-1761) determined to build a wall round the whole city, and entrusted the work to Jivajipant Khasgivale who was commandant or *kotval*. According to the local story Ram Raja (1749-1777) of Satara considered that only villages and not large towns with powerful masters should be walled, and ordered the work to be stopped. According to Grant Duff, and this is probably the true reason, the Peshwa on second thoughts decided that walls might be a danger as their strength might tempt the head of the state to stand a siege in the city instead of retiring to the strong hill fort of Purandhar. Whatever the reason, the work was abandoned. The unfinished part may be seen near the Nagjhari or Cobra stream which passes north through the east of the city. The wall seems to have been intended to be fifteen feet wide and thirty-five feet high and to be built partly of solid stone and lime masonry and partly of mud and sun-dried bricks. Starting from the north-east corner of the Old Fort, near the younger Shaikh Salla's tomb, the new wall was carried east along the Mutha to where it met the Cobra stream. Near the younger Shaikh Salla's tomb, opposite the present dam or *dharan* known as the Dagdi Pul or Stone Bridge, a gate called the Kumbhar Ves or Potters' Gate was removed about 1835 when Mr. Forjett was head of the Poona police. The roadway was raised eight feet when the *dharan* or causeway was built across the river. The little shrine of Maruti, which used to stand at the west end of the gate, may now be seen in the middle of the street. From the Potters' gate to the Cobra's stream the wall, built of mud and sun-dried bricks, went along the high ground forming the Kumbhar ward and the Kagdipura or Papermakers' ward. It contained doorways leading to the river, but no important gates. From the south-east limits of Kagdipura the wall turned to a bend of the Nagjhari and then south along its left bank. It can be traced to a point known as the Baramori or Twelve Sluice gate on the Ganesh ward road. The length of the wall from the younger Shaikh Salla's tomb to the

Nagjhari is about 350 yards, and the length from the Nagjhari to the Baramori is 850 yards. Between the Nagjhari and the Baramori were two gates. The chief gate, which was in the street known as Lakdi street, leading from the Nagar gate of the Old Fort, was called the Mali Ves or Gardeners' Gate and was close to the gardeners' rest-house or *chavdi*. The second gate was on the approach to the present Daruvala's or Powdermaker's bridge; its name is not known.

Wards.

The City is (1884) divided into eighteen wards *styled peths*, irregular in shape and varying greatly in size. They are of ancient origin and are maintained for revenue, police, municipal, and other administrative purposes. Some of them were founded by the Muhammadans and had Muhammadan names. In 1791 these names were changed, and, in imitation of the town of Satara, some of them were given the names of the days of the week. The wards or divisions, beginning with the part nearest the railway station on the east of the Nagjhari, are six: Mangalvar or the Tuesday ward next the river, and, working back, Somvar or the Monday ward, Rastia's, Nyahal's, Nana's, and Bhavani's. To the west of the Nagjhari are twelve wards: next the river is the Kasba the oldest part of the city, Aditvar or the Sunday ward, Ganesh, Vetal, Ganj, Muzafarjang's, and Ghorpade's. West of these, next the river, are Shanvar or the Saturday ward, Narayan, Sadashiv including Navi, and behind them, to the east, Budhvar or the "Wednesday and Shukravar or the Friday wards.

The following statement shows for the eighteen wards a total area of 9,828,000 square yards and an increase in people from 73,209 in 1851 to 99,421 in 1881. The details are:

Poona City Wards, 1851-1881,

No.	NAMES.	TOTAL AREA.	AREA UNDER HOUSES.	PEOPLE.		
				1851.	1872.	1881.
		Square Yards.	Square Yards.			
1	Mangalvar	485,000	340,000	1195	1742	2192
2	Somvar	545,000	479,000	1752	2995	3808
3	Rastia	365,000	225,000	2533	3676	4267
4	Nyahal	105,000	75,000	665	832	1107
5	Nana	525,000	365,000	2866	4544	5408
5	Bhavani	1,235,000	672,000	3606	5204	6737
7	Kasba	575,000	575,000	8831	10,85	11,89

					5	0
8	A'ditvar	325,000	325,000	7461	8928	9726
9	Ganesh	155,000	155,000	3612	3760	3695
10	Vetal	195,000	195,000	3366	4293	4458

	Total	9,828,00 0	6,808,00 0	73,20 9	90,43 6	99,42 1

Mangalvar.

Mangalvar Ward, 800 yards by 600, with an area of 485,000 square yards and 2192 people, was originally called Shaistepura after its founder Shaistekhan, the Moghal viceroy of the Deccan,[Shaistekhan's governorship lasted from 1662 to 1664. Grant Duff's Marathas, 86-89.] who in 662 was sent to Poona to suppress Shivaji. It has almost no shops and most of the houses are one-storeyed. Except two or three Brahman families of hereditary accountants the people are poor Marathas, Mhars, and Halalkhors. The Marathas are cultivators or labourers, and a few earn their living by making split pulse. The Mhars are chiefly village servants, municipal servants, or labourers, and a few work on the railway. The Halalkhors are chiefly employed as municipal sweepers. The only important road through Mangalvar ward is the approach to the principal fodder and fuel market and cart-stand and to the District Judge's court-house. The other pathways are narrow lanes. The conservancy arrangements are good but there are no proper sullage sewers. The ward is not unhealthy, and the population is scanty. Mangalvar has considerably fallen in importance during the past sixty years. From being the market-place of the old town it has sunk to be the resort of a few pulse-makers. Several ruined mansions bear traces of former prosperity. The only object of note is the fuel and fodder market in the open ground to the north-east of the ward. During the fair season about 500 cart-loads of fuel and fodder are brought in daily and sold.

Somvar.

Somvar Ward, 800 yards by 680, with an area of 545,000 square yards and a scanty population of 3808, was established in 1755 and was originally called Shahapura. Its chief inhabitants are rich Gosavi jewel-dealers and moneylenders, a few Sali weavers, and some Government servants. The houses are large, have generally upper storeys, and are neatly built though wanting in light and air. There are no shops. One large street leads to the railway station. The others are narrow crooked lanes well kept and clean. The water supply is fair and the ward is not unhealthy. It has fallen in importance during the past thirty years, as much of the trade, of which the Gosavis had formerly the monopoly, has passed into other hands. The chief objects of note in Somvar ward are Nageshvar's (17) and Vishnu's temples (38), the latter with a water-lead and a public cistern.

Rastia.

Rastia's Ward, 920 yards by 400, with an area of 365,000 yards and 4267 people, was originally called Shivpuri from a temple of Shiv built by Anandav Lakshman Rastia, the hereditary head of the Peshwa's Horse. The first occupiers of the ward were Rastia's cavalry. The houses are one-storeyed with small backyards. The people are of all castes, chiefly Mudliars from Madras and Bene-Israel Jews originally from the Konkan. Rastia's ward is one of the healthiest and best laid out parts of the city and has a large number of well-to-do Government servants, civil and military pensioners, and a few tradesmen. The streets are broad and straight and the houses are built with brick in straight lines, back to back, with straight narrow sweepers passages between the backyards. The streets and lanes are clean, the conservancy efficient, and the water-supply abundant from a great water-lead from a stream in Vanavdi about four miles to the south-east. Rastia's ward is the healthiest in the city and is not overcrowded. It has prospered during the past thirty years. The most noteworthy object is Rastia's mansion, an immense building (29). A large fair is held yearly in *Shravan* or July-August in honour of Shiralshet a Lingayat Vani banker who is said to have flourished about 500 years ago.

Nyahal.

Nyahal's Ward, 360 yards by 280, with an area of 105,000 square yards and 1107 people, is named after Nyahal, a retainer of the Khasgivale (1755) to whom the third Peshwa Balaji Bajirav entrusted the building of the new walls. It is a small healthy ward. A few well-to-do Prabhus and other retired Government servants have built neat dwellings in it. Most of the other houses are one-storeyed and belong to tailors and weavers in cotton and wool. This ward has no shops. Two streets run through it, both highways from the centre of the city, one to the railway station and the other to the cantonment. The conservancy is good, The ward drains into the Nagjhari stream.

Nana or, Hanuman.

Nana or Hanuman Ward, 1040 yards by 500, with an area of 525,000 yards and 5408 people, was founded by Nana Fadnavis in 1791 for the use of wholesale grain-dealers by whom it is still chiefly peopled. The houses are partly upper-storeyed in large enclosures, partly small. The grain-dealers are chiefly Marwar and Gujarat Vanis, men of means. A

number of Pardeshis have organised a carting business between this ward and the railway station. The large number of country carts which come daily to this quarter of the city give employment to several carpenters and blacksmiths. Many landholders let their enclosures as cart-stands, and also act as brokers or *dalals* in getting employment for the carts. Since the opening of the railway the carting trade has greatly increased. A number of shoemakers or Mochis, from the North-West Provinces and Oudh, make boots for the European and Native troops and for the residents of Poona cantonment which borders on Nana's ward. Part of this ward is held by Mhars and Mangs who find employment as grooms and house servants among the residents of the cantonment. It also contains a number of low-caste prostitutes who live in the quarter known as the Lal or Gay Bazar. There is a small municipal meat market. Nana's ward has one leading street which is the main communication between the city and the cantonment bazar. It is broad and straight, like several others in this quarter, which are well made and metalled. The conservancy is good and the water supply from four public cisterns is abundant. The ward has no sewers. The sullage gathers in cesspools and is removed by manual labour. Nana's ward is thriving and new houses are being yearly added. It is not thickly peopled and is healthy. Its chief objects are: the Agyari or Parsi Fire-temple (62); the Ghodepir or Horse Saint (13), where during the Muharram a sawdust and stucco *tabut* or tomb-image is set on a wooden horse and worshipped; Nivdungya Vithoba's temple (21); and a chapel for the Roman Catholic population of the city and cantonment (22).

Bhavani.

Bhavani Ward, 1500 yards by 825, with an area of 1,235,000 square yards and 6737 people, was also founded by Nana Fadnavis for the use of traders during the time of the seventh Peshwa Savai Madhavrav (1774-1795) and called Borban or the Jujube Copse. It took its name from a temple of the goddess Bhavani belonging to the Deshmukhs. The chief people of Bhavani ward are well-to-do Vanis, wholesale dealers in groceries and oilseeds and general brokers or commission agents, a number of Marwar Vanis who also deal in old furniture and lumber and many carriers who own carts specially made for carrying heavy loads from and to the railway station. One quarter is set apart for Kamathis, another for Kaikadis, a third the Kumbharvada for potters, a fourth for Sarvans or Musalman camel-drivers, and a fifth for Malis, vegetable and sugarcane growers. Almost all of these classes are comfortably off. Bhavani ward has two main streets running east and west which meet at their eastern ends and run into the cantonment bazar. The houses of the upper classes are upper-storeyed and built in lines, and those of the poorer classes have only one storey and are irregularly built. In the east of the ward are several well-built Poona and Bombay Parsi residences. The conservancy arrangements and water supply are good. Bhavani ward is less healthy than the north of the city and less prosperous than Nana's ward. The chief objects are Bhavani's (7) and Telphala Devi's temples.

Kasba.

Kasba Ward, 800 yards by 720, with an area of 575,000 square yards and 11,890 people, is the oldest inhabited part of Poona city. It is called Kasba because it was the head-

quarters of a sub-division of the district. Compared with the eastern wards the population is dense and the death-rate high. Except a few large old mansions of chiefs and gentry most of the houses are small and poor. There are no shops. Except some high Brahman families the people of Kasba are chiefly craftsmen, papermakers in Kagdipura, potters in Kumbharvada, fishermen in Bhoivada, Mujavars or keepers of the two Shaikh Salla shrines, copper and silver smiths in Kasar Ali gardeners in Malivada, and Brahman astrologers and Brahman priests in Vevharali. As the ground is rough with ruins the lanes are narrow crooked and broken by dips and rises. Even the main thoroughfare to the District Judge's court is narrow, crooked, and uneven. The conservancy is good. Sewers carry off the sullage, and the surface drainage is greatly aided by the unevenness of the ground. Kasba ward has remained steady since the beginning of British rule. Its objects are: the Ambarkhana (1), the Purandhare's mansion (27), the elder and the younger Shaikh Sallas tombs (31), and a temple of Ganpati (12). Under municipal management much has been done to improve this ward.

Aditvar.

Aditvar or Ravivar, the Sunday Ward, 750 yards by 475, with an area of 325,000 square yards and 9726 people, was originally called Malkampura, and was founded in the time of the third Peshwa Balaji Bajirav (1740-1761), by Mahajan Vevhare Joshi. It is thickly peopled and is the richest ward in the city, the business centre of Poona. The houses are large and strongly built, except in one or two poor quarters, all having an upper storey and many two storeys. The houses fronting the main streets have their ground-floor fronts set out as shops, the back parts and upper floors being used as dwellings generally by the shopkeepers. The people of Aditvar ward are mixed and are the richest in the city. The Moti Chauk or Pearl Square, at the north end of the chief street, has Gujarati Vaishnav and Jain banking firms on the upper floors, the ground floors being occupied by wholesale grocers. Further south in Saraf Ali or Moneychangers' Row on the east side are jewellers, on the west side Brahmans Sonars and Kasars who manage the sale of the Poona brass and copper ware, one of the most prosperous industries in the city, the articles being sent chiefly to Berar and Nizam Haidarabad and occasionally to other parts of India. Further south along the street are Bohoras, some dealers in iron and tin ware, others in silk and embroidered cloth, others in stationery and haberdashery ; mixed with the Bohoras are some Jingar or native saddle and horse-gear sellers; still further along are the chief turners who make wooden toys, and a few Marwar Vanis who deal in small brass castings, bells, cups, saucers, and tumblers. The eastern street has the chief establishment for grinding flour in Maide Ali. At the south end is the Kapad Ganj or Cloth Store, where wholesale and retail cloth-merchants live. Further north is the Badhai Row where Badhais or Upper Indian carpenters make and sell wooden toys, boxes, and cots. Beyond the Badhais are a few vegetable shops, then a fish market, and the stores of lime and charcoal makers and sellers. On the south-east and south-west flanks are two meat markets, the south-east market kept by the Municipality. In the eastmost end of Aditvar ward are two horse dealers, and veterinary stables where horses are imported, exchanged, and sold. There is also a grass market in a building known as Durjansing's Paga or the horse lines of Durjansing a Rajput cavalry officer. Among the mixed dwellers in Aditvar ward a few are Brahmans and most are of the different craftsmen classes. The

leading streets are broad, especially in the Moti Chauk or Pearl Square, which is the handsomest street in the city, with broad paved footpaths, the shops opening on the central cart and carriage road. The conservancy of Aditvar is good; there is abundance of water, and there are underground sewers for sullage and surface drains for flood water. Still the ward is not healthy. The banking firms are said to be on the decline, due to the Government money order system, the greater safety of investment in Government loans or savings bank, and the restriction of currency to silver. Other trades and crafts flourish. The chief objects of Aditvar ward are Phadke's Mansion (26), the Bohoras' Jamatkhana or Meeting-house (8), the Jama or Public Mosque (14), and Someshvar's temple (34).

Ganesh.

Ganesh Ward, 600 yards by 260, with an area of 155,000 square yards and 3695 people, takes its name from the god Ganesh. The ward was founded by Jivajipant Khasgivale, during the rule of the seventh Peshwa Savai Madhavrav (1774-1795). The houses in Ganesh ward are poor, few except those fronting the main streets having upper storeys. The people are of low caste, labourers, artisans, shoemakers, carpenters, coach-builders, basket-makers, and the like. The chief timber stores of Poona are in Ganesh ward. It has no other industries and no shops. The streets in Ganesh ward are broad, the lanes narrow but straighter than in other parts of the city, and all are metalled or sanded and kept clean. The conservancy is good, but the ward though prosperous is comparatively unhealthy. Its objects are: the Dulya or Rocking Maruti's Temple (11), and the Dagdi Nagoba where a fair is held on Nagpanchmi or the Cobra's Fifth in *Shravan* or July-August.

Vetal.

Vetal Ward, 800 yards by 240, with an area of 195,000 square yards and 4458 people, originally called Guruvar or Thursday ward, was founded by Jivajipant Khasgivale in the time of the third Peshwa Balaji Bajirav (1740-1761). It continued to be called Guruvar until a temple was built to Yetal the Lord of Demons. The main street of Vetal ward is a southerly continuation of the main street of Aditvar and is like it in construction. The houses are closely built with upper storeys, the lower being used as shops and the upper as dwellings. The chief shopkeepers are Jingars originally saddle-makers, or Tambats that is coppersmiths. The best goldsmiths of Poona live in Vetal ward, Kachis or market-gardeners who deal in fruit and vegetables have a quarter of the ward, Dhangars or shepherds have another, and potters a third, and there are a few flower sellers, Gujarat brass and copper dealers, and Momin and other Musalmans, silk weavers and spinners. Most of the craftsmen's houses have no upper storey. Vetal ward is on a high level and is healthy. The water supply is less plentiful than in low-lying wards but it is not scanty, and the conservancy is good. The leading roads are broad metalled thoroughfares and the lanes are broader and straighter than in other parts. At the south of this ward three mansions have been built by three Bombay merchants, Nana Shankarshet, Keshavji Naik, and Trimbakji Velji. Lately, Trimbakji's house has been bought by the Society for the Propagation of the Gospel and turned into a mission house and school under the management of missionaries of the Society of St. John the Evangelist. A little colony of Native Christians lives in and round this mission-house. Vetal ward has prospered during

the past thirty years. A vegetable, meat, and fuel market is held daily. Its objects are: Shri Parasnath's Jain temple (25), Vetal's temple (37), the Mission House, and the Raje Bagsher's Takya.

Ganj.

Ganj or Store Ward, 900 yards by 450, with an area of 405,000 square yards and 4969 people, takes its name from having been the chief salt store in the city. Most of the houses have only one storey and belong to the poorer classes of craftsmen and labourers, Momin silk-weavers, Sali cotton-weavers, Koshti spinners and weavers, Kunbi Joshis or fortune-tellers, Tumbdivales or Bairagis who change small metal pots for old clothes, Lingayat and Maratha Dalvalas or pulse-makers and salt-sellers, a few Sangar wool-weavers and felt-makers, tanners of the Chambhar Saltangar and Dhor classes, and some Pardeshi masons or Gavandis. Ganj ward is healthy, the conservancy is good, and the water supply though not abundant is not scanty. It is a prosperous ward though almost the whole people are low class. It has no object of interest.

Muzafarjang.

Muzafarjang Ward, 300 yards by seventy-five, with an area of 23,000 square yards and ninety people, is the smallest ward in the city. It is much like Ghorpade's ward. It takes its name from its founder Muzafarjang who is said to have been a leading captain under one of the Ghorpades.

Ghorpade.

Ghorpade's Ward, 900 yards by 725, with an area of 655,000 square yards and 1139 people, was established by Maloji Raje Bhonsle Ghorpade in the time of the seventh Peshwa Savai Madhavrav (1774-1795) and called by the founder's surname. It was originally occupied by Ghorpade's cavalry. It is now occupied by dealers in skins and hides, tanners, shoemakers, husbandmen, and poor Musalmans. It is the poorest ward in the city. The houses are mostly ground-floor huts. The roads are not regular though broad, the water-supply is scanty, and the conservancy arrangements are fair. It is not prosperous. The Ghorpade family once had a large mansion in this ward but it has fallen to ruin and been pulled down. It has no object of interest.

Shanvar.

Shanvar or Saturday Ward, 750 yards by 600, with an area of 445,000 square yards and 7786 people, was founded about the close of the seventeenth century by the Musalmans and named Murchudabad. As the west end and airiest part of the city it rose to importance under the eighth or last Peshwa Bajirav (1796-1817) when many Brahmans built houses in it. The houses are comfortable, upper-storeyed, strongly made buildings, with more or less large enclosures. There are no shops. The people are chiefly rich high-class Brahmans, some the descendants of old families of position, others of families who have risen to position and wealth in the service of the British Government. The chief

vegetable and fruit market of Poona, the Mandai, is hold in Shanvar ward on the border of Kasba ward in the open ground in front of the Shanvar Palace, also called the old Palace, the state residence of the Peshwas (1760-1817). This was styled the Old Palace to distinguish it from the new or later built palace in Budhvar ward. The whole Shanvar ward has underground sewers in fair order, and the general conservancy of the ward is excellent. Still, especially in the cold weather, it is feverish perhaps owing to its trees and its nearness to the river. Its objects are: Shanvarvada, the Old Palace which was burnt in 1825 and is now the head-quarters of the police (32), the Mandai the chief market-place of the city, Omkareshvar's temple (23), Harihareshvar's temple, Amriteshvar's temple (2), Shanvar Maruti's temple, the Panjarpol or Animal Home (4), and eighteen family mansions. [These are: Sanglikar's, the younger Jamkhandikar's, Rastia's, Natu's, Mehendale's, Gadre's, Gole s, Alibag Bivalkar's, Rayrikar's, Parasnis', Hasabnis', Chandrachud's, the younger Purandhare's, Shirke's, Thatte's, Rajmachikar's, Bavdekar's and Apte's.]

Narayan.

Narayan Ward, 1130 yards by 325, with an area of 375,008 square yards and 3563 people, is the westmost ward in the city on the river side. The ward was founded during the time of the fifth Peshwa Narayanrav Ballal (1773) and named after him. The streets are broad. Its western position made it a great rice centre Marwar Vanis sought for houses and gradually brought all the Mavlis or West Poona rice growers under their power. The Marwars houses are ill-built, low, and badly aired, and the ground floor fronts are used as shops. The rest of the people of Narayan ward are husbandmen, labourers, and shepherds. The south-east quarter which is called Dolkar Ali, is held by Brahmans who have large enclosures and well built houses. It is a popular quarter and many houses have lately been built by Poona Brahmans. The original Marwari rice market has declined. The streets are metalled and the conservancy is fair. The west is not so well provided with public cisterns as the east, but almost every house has its well of whole some water. As a whole Narayan ward is healthy and prosperous.

Its objects are Modicha Ganpati's temple, Maticha Ganpati's temple, Ashtabhuja or the Eight-armed goddess's temple, the Gaikwar's mansion, and Mankeshvar's Vishnu.

Sadashiv.

Sadashiv Ward, 1800 yards by 1275, with an area of 2,275,000 square yards and 8366 people, was founded by Sadashivrav Bhau, cousin of the third Peshwa Balaji Bajirav (1740-1761) on the site of a garden called Napur. The people of Sadashiv ward are chiefly Brahmans and there are some large well built *chals* or lodgings for the use of the poorer classes who are chiefly paid or hired house servants. The houses are the best built residences in the city two or more storeys high and each in an enclosure. The Brahmans in this quarter are either political pensioners or retired Government servants. A few are moneylenders. When founded this ward was occupied by the military, the streets are consequently broad and the thoroughfares laid out in regular squares. The Peshwas' state prisoners were kept in this ward under the charge of the military force of which

Sadashivrav Bhau, the founder of the ward, was the first commander. Under the eighth or last Peshwa Bajirav (1796 -1817) the Sadashiv ward stretched to Parvati and was the most populous part of the city. It declined with the removal of the Maratha soldiery and the market disappeared. Sadashiv ward has the best kept and best made roads in the city. It has underground sewers for sullage and rain water, a plentiful water supply, and a good conservancy. It is not so healthy as it ought to be, perhaps from the richness with which some of the gardens are manured. Of late years Sadashiv ward has become popular and many good houses have been built. Part of Sadashiv ward is called Navi or new because it was built after Poona passed to the British. Its people are husbandmen, shoemakers, and Mangs. It has some timber fuel and grass stores. The felling of old mansions was at one time a trade in which several people made fortunes. Its objects of interests are: the Lakdi Pul or Wooden bridge now of stone, Vithoba's Murlidhar's and Narsoba's temples (19), Khajina Vihir, Nana Fadnavis' cisterns and water-lead, Vishrambag mansion partly destroyed by fire in May 1879 (40), the Pratinidhi's mansion or Got, Sotya Mhasoba's temple, the Sassoon Infirm asylum (30), Parvati lake (91), Turquand's garden-house where Mr. Turquand of the Civil Service committed suicide, and Nana Fadnavis' garden.

Budhvar.

Budhvar Ward, 460 yards by 400, with an area of 185,000 square yards and 6083 people, is the heart of Poona city. It was founded by the Emperor Aurangzeb in 1690 and was first called Mahujabad. It was afterwards peopled by Govind Shivram Khasgivale in the time of the fourth Peshwa Madhavrao Ballal (1761-1772). It is the most peopled part of the city and has several retail markets. The streets were once very narrow but of late years the leading thoroughfares have been widened. The houses are closely built and have one or two upper storeys. The ground floor fronts as elsewhere are let for shops, the back parts and upper rooms being private dwellings. Beginning from the north end of the ward, the first section of the main street contains grocers' and scent-sellers' or Gandhis' shops. Near the site of the Budhvar Palace (9), which was destroyed by fire in May 1879, are shops of flower-sellers, stationers, and druggists. Near the Tulsi Bag (37) or Basil Garden end of the street a building in the centre of the street, called the Kotval Chavdi (15) was the chief police office in the Peshwas' time. The building has been sold by Government and is now used as a vegetable market. The street running east and west by the site of the Budhvar Palace contains on the west Hindu confectioners' shops, and, further on, snuff-makers' petty grain-Sealers' and flour-sellers' shops. The eastern section contains a few silk weavers who dress ornaments and trinkets in silk, and the leading doth merchants or Shimpis of the city who chiefly sell the produce of local hand-looms. The street is called Kapad Ali or Cloth Row. It once had a well-built pavement and long lines of platforms in the centre on which shops were laid out and a market was held daily called the Men Bazar or Settled Market. The Budhvarvada or Wednesday Palace (9), the favourite residence of the last Peshwa (1796-1817), stood in the centre of this ward and contained all the leading local revenue, police, and judicial offices. In the corner nearest the cross streets was the Native General Library and Clock Tower presented to the city by the chief of Vinchur in commemoration of the visit of H. R. H. the Duke of Edinburgh to India in 1872. The palace, as well as the Library and the Vinchur Clock Tower, were destroyed by an incendiary on the night of the 13th of May 1879. As it contains the Anandodbhav (3)

and Appa Balvant theatres as well as the chief business centres, Budhvar ward is a favourite resort in the afternoons and evenings. The people of Budhvar ward are extremely mixed all being traders and well-to-do. The water-supply is plentiful, the streets have under ground sewers and side channels for rain drainage, and the conservancy is good. It is healthy and prosperous though the population is thick and the houses are badly aired. Its chief objects are: Belbag temple (6), Bhangya Maruti's temple, the Kotval Chavdi (15), Tambdi Jogeshvari's temple (35), Kali Jogeshvari's temple, Khanali Ram's temple, Moroba Dada's mansion (16), Bhide's mansion, Dhamdhare's mansion, Thatte's Rani's temple, and Pasodya Maruti's temple.

Shukravar.

Shukravar Ward, 1750 yards by 550, with an area of 955,000 square yards and 14,137 people, was established by Jivajipant Khasgivale in the time of the third Peshwa Balaji Bajiray (1740- 1761)1 Jivajipant, as *kotval* or police head of Poona, for many years exercised great magisterial and, revenue powers. He is said to have been intelligent and able and to have taken much interest in the welfare of the city. He founded several wards, regulated public markets and places of amusement, and did much to further the prosperity and welfare of the people of Poona. Shukravar is the largest ward in the city both in area and population. The houses in the leading parts are upper-storeyed, roomy, and substantial. The houses of the poorer classes, in the back and distant parts, have only one floor but they are not closely built and are comparatively roomy. The people are most mixed, belonging to all castes and in every condition of life, from the Pant Sachiv of Bhor a Brahman chief to the day-labourer. Jivajipant Khasgivale, the Kotval of Poona and the founder of the ward, left a residence with a large garden, and temple attached to it. Beginning from his residence, which is at the north-west end of the ward, the main street runs south, and passes through lines of dwellings of rich Brahmans to the site of the Shukravar Palace (33) which was pulled down about 1820 and the Peshwa's Talimkhana or gymnasium where are now the municipal office, and the dispensary established in 1861 by Khan Bahadur Pestanji Sorabji a Parsi gentleman of Poona. Further south the street passes by the Pant Sachiv's mansion and Panse's mansion to the City Jail (10) which was the head-quarters of the Peshwa's artillery of which the Panses had charge. West of the street is the Kamathi quarter occupied chiefly by people of Kamathi or Telugu castes, who, in the Peshwa's time, were domestic servants of the leading Brahmans and Maratha grandees. Beyond Kamathipura the street passes through houses belonging to Maratha husbandmen and Native Christians. The east street of Shukravar runs parallel to the main street and borders on the Aditvar ward. At the north end of it is a large retail grain market; further south is the Shimpi row held by Shimpi cloth-merchants. Behind the main houses on the east is the Hattikhana or elephants' stable, now filled with the huts of Chambhars. Further to the south are the Alang or infantry lines occupied chiefly by labourers. Further north-east, along the main street, was the old Gadikhana or Peshwas' stables, now occupied by dwelling houses Further still is the residence of the late Nandram Sundarji Naik, an enterprising and intelligent Pardeshi Kumbhar, who had a large share in the early municipal management of Poona city after it came under the British Government. Further is the Chaudhari's mansion and then a quarter occupied by a small colony of Pardeshi potters who either work as labouring masons or take jobs as

contractors. At the south end of this street is the house of Mr. Bhau Mansaram, another enterprising and active Pardeshi potter, who has amassed a fortune as a contractor in the Government Public Works Department, and is a Municipal Commissioner for the city of Poona. Beyond this are the Malivada and the Jhagdevada quarters occupied by Kunbis and husbandmen. The leading roads of Shukravar ward are broad, straight, and metalled. The lanes are narrow and crooked but have latterly been all levelled and sanded and thrown open where they were previously closed. The water supply is abundant and the conservancy good. Shukravar is one of the healthiest quarters of the city and is prosperous and flourishing. Its objects of interest are: the Tulsi Bag or Basil Garden (36), Lakadkhana, Kala Haud or the Black cistern, Bavankhani, Rameshvar's temple (28), the Peshwa's Gymnasium now the municipal office and dispensary, the City Jail (10), Pant Sachiv's palace, Chaudhari's mansion, Nandram Sundarji's mansion, Bhau Mansaram's residence, the Hirabag or Town Hall and garden, and a temple of Parasnath.

Streets.

The chief streets run north and south. The three leading streets are the Ganj, Ganesh, and Mangalvar street; the Vetar, Aditvar, and Kasba street; and the Shukravar and Budhvar street. All of these are broad metalled roads with stone-built slab-covered side-gutters. When metalled roads were first made, a convenient width, varying from eighteen to twenty-four feet, was taken for the clear carriage roadway, and spaces meant for footpaths were left on the sides. These, before municipal times, were encroached on by bouse-owners or covered with low unsightly verandas with sloping tiled roofs. No through streets run east and west, and the broken streets of which there are some, have also been encroached on and narrowed by veranda-building. It has been one of the chief aims of the Municipality to widen the streets and open them as opportunity offers. Much has been done in this way, but a great deal remains to be done. The streets are generally of irregular width and winding. Where they have not been encroached on, the streets of the newer parts of the city, as in the Rastia Nana and Sadashiv wards, are broad, straight, and regularly laid out. The handsomest street in the city is the Moti-chauk or Pearl Square in Aditvar ward. Between lines of closely built high buildings this street has a carriage-way twenty-four feet wide in the centre, then covered side-gutters three feet wide on each side, and next paved footpaths fifteen feet wide, raised about a foot above the carriage-way. All the streets in the city have metalled carriage roads, varying from sixteen to forty feet in breadth, and side-gutters covered with slabs where the traffic is great and open in other places. Where available the spaces between the gutters and the lines of houses have been and are being planted with trees and laid out in gravelled walks. The city has now thirty-two miles of metalled road. The lanes vary in breadth from six to sixteen feet. They are crooked and used to have many ups and downs. They have lately been levelled and gravelled and, where possible, widened and opened. The whole length of lanes within city limits is fourteen miles. Under the Marathas some of the streets and lanes were paved, the pavement sloping from the houses to the centre which formed a gutter for storm-water during the rains. The centres of the broader thoroughfares used then to be occupied by lines of stalls on raised platforms. Almost every street and lane had gates which were closed at night. The pavement, shop-platforms, gates, and other obstructions have now been removed and the ventilation of the city improved. The streets are now

named, swept clean once a day, watered during the dry weather to lay the dust, and on dark nights lighted with 572 kerosine lamps.

Bridges.

Poona City has the Mutha river on the west and north. The oldest crossing of the Mutha is by the Kumbhar Ves Dharan or Potters' Gate Causeway in Kasba ward, near the younger Shaikh Salla's tomb (31) and about 600 yards above the railway bridge. The Maratha causeway gave way soon after the beginning of British rule and was renewed between 1835 and 1840 at a cost of about £3000 (Rs. 30,000) partly met by Government and partly by contributions. The causeway, which is of solid stone masonry, is 235 yards long and seven yards broad. It has twelve nine-foot sluices which are closed in the dry season to store water. During floods the causeway is covered and impassable. At the north-west end of the city, about a mile and a quarter above the Potters' Gate dam, the Maratha wooden bridge across the Mutha gave way in 1840 and was replaced by a stone and brick masonry bridge which is still known as the Lakdi or wooden bridge. The present bridge has nine forty-eight-foot arches built of brick on stone piers which have sharp cut, waters to break the force of the floods. Large round holes are made high up on the spandrels between the arches through which water passes during the highest floods. The roadway over the bridge is eighteen feet wide. The bridge cost £4700 (Rs. 47,000) of which Government paid £3600 (Rs. 36,000). Before the railway was made the Lakdi bridge was the outlet to Bombay and carried much traffic. It is still largely used chiefly in bringing supplies of wood and provisions into the city. The second and chief bridge over the Mutha is the Wellesley Bridge named after General Arthur Wellesley in honour of his Deccan victories. The old bridge was built in 1830 entirely of wood. In 1839 it was replaced by a strong masonry bridge at a cost of £11,093 (Rs. 1,10,930), and a fresh bridge was built also of stone in 1875. The bridge keeps its original name of Wellesley or Vasli in Marathi. The Nagjhari stream which passes through the city from the south is crossed by six bridges. Beginning from the north, the Jakat or Toll bridge of cut-stone masonry with three twelve-foot wide vents, twenty-four yards long and with a roadway of twenty feet, joins the Mangalvar and Somvar wards on the east or right bank with the Kasba ward on the west or left bank. It was built by the British Government between 1836 and 1840. It is called the Toll bridge because it is on the the of the Peshwas' chief toll. About four hundred yards south, joining the Somvar Rastia and Nyahal wards on the east with Aditvar ward on the west, is the Daruvala's bridge, the largest across the Nagjhari, of cut-stone masonry fifty-eight yards long and over thirty-two feet broad, with four twelve-foot vents. It was built by the Municipality in 1870 at a cost of £1500 (Rs. 15,000). It gets its name from being near the firework-makers' quarter. About 300 yards south of Daruvala's bridge, joining Ganesh ward with Rastia ward, a footbridge called the Parsi bridge, a stone causeway impassable in floods, is six feet wide and has three five-foot vents. It was built in 1830 by the family of the Parsi high-priest or Dastur. About 150 yards south of the Parsi bridge, the Ganesh ward bridge, of cut-stone with twenty-foot roadway and three arches of sixteen feet each, joins the Ganesh and Nana wards. It was built by the British Government in 1835. About 400 yards south of Ganesh ward bridge the Burud or Basketmakers' bridge, of cut stone masonry with eighteen-foot roadway and four nine-foot arches, joins the south end of Aditvar ward on the west to Bhavani ward on

the east. It takes its name from the basket-makers in whose quarter it lies. It was built by a Badhai or Upper Indian carpenter between 1840 and 1845 as a work of charity. About 300 yards south of the Burud's bridge, Ghasheti's bridge, of solid stone masonry, twenty feet broad and with three eighteen-foot arches, joins Bhavani ward on the east with Ganj and Vetal wards on the west. It was built as a work of charity in 1845 at cost of £180 (Rs. 1800) by a dancing-girl named Ghasheti. The Manik stream, which forms the eastern boundary of the city, is crossed by three bridges. Beginning from the north, about 150 yards from its meeting with the Nagjhari, where the bed of the Manik is at times impassable from backwater from the river, the Halalkhor bridge, a massive masonry structure sixty-eight yards long and eighteen feet wide with three five-foot vents, joins the Somvar ward on the south with the Halalkhor section of the. Mangalvar ward on the north. It was built by the British Government between 1835 and 1840. About 500 yards in a direct line south-east of the Halalkhor bridge is the Gosavi bridge. It is a double masonry bridge, both portions skew to the line of the stream, of two single arches of twenty-two feet span, the roadway over the one being twenty-four and over the other thirty-two feet wide. It was built in 1870 by the Municipality at a cost of £300 (Rs. 3000). About 350 yards south of the Gosavi bridge, the Bhatti Gate bridge, a small culvert of two seven-feet vents, opens Rastia ward into the Civil Lines quarters. It was built by a public works contractor in 1845 and took its name from the brick and tile kilns near it.

Houses.

The municipal statements divide the houses of the city into five classes: large mansions or *vadas*, how rarely built and becoming fewer costing £2000 to £6000 (Rs. 20,000 - 60,000) to build and £5 to £7 10s. (Rs. 50 - 75) a month to rent; second class houses, of which the number is growing, costing £800 to £1500 (Rs. 8000 - 15,000) to build and £2 to £4 (Rs. 20 - 40) a month to rent; third class houses, of which the number is growing, costing £100 to £300 (Rs. 1000-3000) to build and 8s. to £1 (Rs. 4-10) a month to rent; fourth class houses costing £20 to £50 (Rs. 200 - 500) to build and 2s. to 4s. (Rs. 1 - 2) a month to rent; and fifth class houses or huts costing £2 to £5 (Rs. 20 - 50) to make and 6d. to 9d. (4-6 as.) a month to rent. The poorest classes have rarely houses of their own, but lodgings or *chals* are being made for them in different parts of the city, neater and better-planned than their former huts. According to the municipal returns for 1883, of 12,271 houses, 85 were of the first class, 631 of the second class, 2699 of the third class, 4197 of the fourth class, and 4659 of the fifth class. The details are:

Poona Houses, 1883.

No.	WARD.	CLASS.					
		1st.	2nd.	3rd.	4th.	5th.	Total.
1	Mangalvar	--	1	19	80	200	300
2	Somvar	2	25	89	166	122	404

	Total	85	631	2699	4197	4659	12,271

Poona houses have little beauty or ornament; even the finest are plain, massive, and monotonous. The plinth is of close-joined blocks of polished stone. The posts and beams are massive but short. The ceilings are made of smaller closely fitted beams sometimes ornamented with variegated geometrical figures and flowers made of small chips or slits of gaily painted wood or ivory. If width is wanted it is secured by two or three rows of wooden pillars joined together by ornamental ogee-shaped cusped and fluted wooden false arches. The pillars, which generally spring from a carved stone or wood pedestal, have shafts carved in the cypress or *suru* style and lotus-shaped capitals. The eaves are generally ornamented with carved plank facings and project boldly from the walls. The roofs are either terraced or covered with flat tiles. The staircases are in the walls, and are narrow and dark. At present in house-building more attention is paid to light and air, the staircases are improved, and ornamental iron or wood railings are coming into use for balconies landings, and staircases. Most houses stand on stone plinths. They are generally wooden frames filled with brick or mud and covered with a tiled roof. Some are substantially built of brick and lime others are wholly of brick and mud. The centre rooms are generally dark and close, but the upper storeys are airy and well lighted. The walls of some are painted with Puranik war scenes and deities. The houses of the better-off have two and some have three to six rooms one of which is the cook-room or *sayampak-ghar*, another if there a one to spare is set apart as the god-room or *devghar*, one or more an used for sleeping, one large room as the *majghar* for dining and sitting

and one, which is generally open on one side, as a reception room or *osri*. Most of the rooms are badly aired. Houses of this class rarely have upper storeys. Their long slopes of tiled roofs and low slender wooden posts give them a mean poverty-stricken look. Middle-class houses have generally an upper floor over part of the basement. Open spaces or yards called *angans* are left in front and behind. Sometimes, over the entrance gate, is a hall or *divankhana* which is used on great days and family ceremonies. Under this hall stables, cattle-sheds, and privies, open on the road. Each house has generally a well, and sets apart the room nearest the well for cooking, and the next room for dining. A room is set apart for the women of the house and the front room is used for visitors. The side-rooms are used as god-rooms and store-rooms. The upper rooms, which are well aired, serve as sleeping rooms. The centre rooms on the ground floor are generally ill-aired and so dark that, even by day, lights have to be used during meals. The walls and floors are cowdunged or mud-washed and kept clean. The houses of the upper classes are upper-storeyed in two or three quadrangles or *chauks* surrounded by rooms. The paved back quadrangles, where there is generally a well, are used for washing and bathing. The distribution and general arrangement of the rooms is the same as in middle-class houses. The open rooms on the basement near the entrance are used as stables, cattle-sheds, and servants' rooms. Almost every Hindu house, from the poorest hut to the richest mansion, has a few plants near it among which the sacred basil or *tulsi* is the most prominent and stands in an ornamental earthen pot on a stone or cement pedestal. Near the place where the waste water gathers are generally a few plantain trees or a small bed of *alu* or caladiums as they are believed to suck in and to clean stagnant water. The houses of the poorer classes have generally one room eight to ten feet square with a small door shaded by an open veranda four to six feet wide, a part of which is enclosed for a bath-room or *nhani*.

Population.

The earliest record of Poona population is for 1780 when it is roughly estimated to have numbered 150,000 souls. During the eight years (1796-1803) of unrest in the beginning of Bajirav II.'s reign, the population fell considerably, chiefly through the depredations of Daulatrav Sindia his father-in-law Sarjerav Ghatge and Yashvantrav Holkar, and then rest scarcity of 1803. At the beginning of British rule the estimated population varied from 110,000 to 150,000; and in 1825 Bishop Heber puts down the number at 125,000. The first reliable record is for 1851 when it numbered 73,209. The opening of the railway in 1856 raised the number to 80,000 in 1864, and since then there has been a steady advance to 90,436 in 1872 and 99,622 in 1881. [The figures for 1872 and 1881 do not include the population of Poona and Kirkee cantonments which was 28,450 in 1872 and 37,381 in 1881.] Of the 1872 total, 80,800 were Hindus (including 587 Jains), 9013 Musalmans, 262 Christians, and 361 Others. Of the 1881 total 87,874 were Hindus, 10,519 Musalmans, 562 Christians, 206 Parsis, and 461 Others.

Priests.

Priests numbering 1062 are mostly Hindus and a few Musalmans. The Hindu priests, who are almost all Brahmans live mostly in Brahman quarters in the Budhvar, Kasba,

Narayan, Sadashiv, Shanvar, and Shukravar *peths*; but the most popular wards are the Sadashiv and Shukravar *peths*. Most of them are hereditary priests and are fairly off, but not so well off as they were some fifty years ago. Of late they do not command respect, and crave favour and cringe for patronage. Their number is falling off, and only one or two members of priestly families take to priesthood.

They are thrifty, well-behaved and shrewd, but rather idle. Their wives mind the house and do no other work. They send their boys to school, and as priesthood does not pay them much, some of them teach their boys English. Like Hindu priests, Musalman priests are not much respected, and are fairly off. Besides Hindu and Musalman priests there is one Parsi priest, who is respected well-paid and is comfortably off.

Lawyers.

Lawyers numbering 126, of whom ninety-six hold *sanads* or certificates and thirty are allowed to plead without *sanads*, are mostly Brahmans. They are well-behaved, respectable, shrewd, and thrifty. Most of them are men of means and lend money. Their wives do the house work generally with the help of servants, and their boys go to school and learn English.

Government servants.

Government servants live in all parts of the town. They are Brahmans, Prabhus, Marathas, Hindus of other castes, Musalmans, Parsis, Christians, and Jews. Of the Brahmans Chitpavans or Konkanasths Deshasths and Shenvis are largely in Government service. Chitpavans came to Poona during the supremacy of the Peshwas who were themselves Chitpavans. Deshasths are old settlers, and Shenvis, most of whom are Government clerks, are mostly new-comers. Some Brahmans hold high places in the revenue judicial and police branches of the service, others are clerks, and a few messengers and constables. The Prabhus, who are of two divisions Kayasths and Patanas, are chiefly clerks and a few hold high revenue and judicial posts. The Kayasths came from the North Konkan during Maratha rule and some of them are settled in the town. Patanas mostly went from Bombay with the English and except a few are not permanently settled. The Marathas are constables and messengers and a few clerks. With the exception of a few who are clerks, Hindus of other castes are constables and messengers. The Musalmans are constables and messengers, a few are clerks, and some hold high posts. The Parsis Christians and Jews are mostly clerks. Of Government servants Hindus are thrifty and others love good living and spend much of their income. Of both Hindus and others only those in high position are able to save. Their wives do nothing but housework, and all but a few messengers and constables send their boys to school.

Practitioners.

Besides the Government medical officers and teachers of the Medical School, Poona medical practitioners include graduates in medicine, retired subordinate employes of the

Government medical department, Hindu *vaidyas*, and Musalman *hakims*. The graduates and pensioners of the medical department are Brahmans, Kamathis, Marathas, Musalmans, Parsis, and Christians. They prescribe European medicines and a few of them keep dispensaries. They get fixed fees for visits and charge separately for prescriptions dispensed in Medical Practitioners their dispensaries. Except Kamathis and Marathas who are more or less given to drink, most of them, especially the graduates, are hardworking thrifty and respectable. They get good practice and save. Their wives do nothing but house work and they send their children to school. *Vaidyas* or Hindu physicians are mostly Brahmans and live in the Brahman quarter. They prescribe native drugs and are generally called to attend women who often refuse to take English medicines. *Hakims* or Musalman physicians live in the Musalman quarter, and practise among Musalmans. The *vaidyas* and *hakims* get no fixed fees and often bargain to cure a certain disease for a certain sum of money. They are fairly off and do not save much. Besides these regular doctors, there are midwives and Vaidus or wandering drug-hawkers. The Vaidus mostly came from the Nizam's country and settled near Poona in the times of the Peshwas. Except a few leading men, who study their Sanskrit books written on palm leaves, most of them receive oral instructions, hawk drugs in streets, and prescribe and bleed among the low classes. They hardly earn enough to maintain themselves and are badly off. Besides minding the house their wives hawk drugs and make and sell quartz powder for drawing traceries on house floors. They teach their boys their craft and do not send them to school.

Landlords.

Landlords include *inamdars* or estate-holders, large landowners, and house-owners. *Inamdars* are mostly Brahmans and Marathas. Partly from the number of dependants and partly from the large sums they spend on marriages and other ceremonies men of this class, especially Marathas, are badly off and most of them are in debt. They send their boys to school and some of them, especially Brahmans, have risen to high posts in Government service. Large landowners are men of all castes. They are well-to-do and educate their children chiefly for Government service and as pleaders. House-owners are Brahmans, Gujarat Vanis, Bohoras, and Musalmans. For the last twenty years houses have been in great demand and house-building has become a popular form of investment. Like large landowners they are well-to-do and send their children to school.

Pensioners.

On account of its cheap living, good climate, and the facilities it affords in educating their children, Poona is becoming a favourite place with pensioners. There are about 240 civil and about 250 military pensioners, the civil pensioners living mostly in the Sadashiv, Shanvar, Shukravar, and Rastia wards and the military pensioners mostly in the Rastia, Nana, and Bhavani wards. They are well-behaved and thrifty, and most of them have some money which they lend on security. They take great care in educating their boys.

Moneylenders.

Of 297 moneylenders the chief are Brahmans, Marwar and Gujarat Vanis, living mostly in the Sadashiv, Shukravar, Narayan, Budhvar, and Kasba wards. Brahmans lend money on the security of ornaments; and Gujarat and Marwar Vanis lend on credit and charge high rates of interest. They, especially Gujarat and Marwar Vanis, are very shrewd and careful in businesses.

Moneychangers.

Moneychangers numbering 310 are chiefly Deshashth Brahmans who live mostly in the Shukravar, Kasba, Ravivar, and Bhavani wards. They sit by the roadside, buy copper coins on premium from, retail sellers and give copper for silver coins without charge. They give small loans to retail dealers at heavy interest and are not very scrupulous in their dealings. They have their own little capital, get brisk business, but are not well-to-do. They teach their boys to read and write Marathi.

Grain Dealers.

Grain Dealers, including about fifteen brokers, number about 200 and live mostly in the Bhavani and Nana wards. They belong to two classes wholesale and retail dealers. The wholesale dealers numbering about forty are chiefly Gujarat and Marwar Vanis. They sometimes act as brokers, and are hardworking, shrewd, and well behaved. They are rich, bringing large quantities of grain chiefly wheat and *bajri* or spiked millet from Vambhori in Ahmadnagar, Indian and spiked millet from Sholapur, and rice from the Mavals in the west of Poona and from Kalyan in Thana. Of 160 retail dealers 108 are Marathas, forty-seven Marwar Vanis, and five Lingayats. They buy grain from wholesale dealers and brokers. They have no capital of their own and have to borrow at nine to twelve per cent on the security of their stock. They are orderly hardworking and thrifty, and have credit with moneylenders. "Wives of poor grain-dealers clean and winnow grain, arrange shops, and act as saleswomen. They teach their boys to read and write Marathi.

Vegetable Sellers.

Vegetable Sellers including brokers number 652, chiefly Kachis and Malis, living mostly in the Ravivar, Kasba, Budhvar, Shanvar, Bhavani, Vetar, Shukravar, Mangalvar, Nana, and Sadashiv wards. The Kachis came from Bundelkhand and Rajputana. Vegetable-growers bring vegetables to the market and sell them to the retail dealers. Sometimes the retail dealers buy the standing crop and bring it to the market in required quantities. Besides the local business, brokers make large purchases for Bombay vegetable-dealers and send consignments of vegetables to Bombay on commission. As a class they are hardworking, orderly, and thrifty. They are fairly off, and their women, who act as saleswomen, do more work than the men. They are not careful to send their children to school.

Grocers.

Grocers, including forty brokers, number 745 and belong to two classes, wholesale and retail grocers, living chiefly in the Ravivar, Vetar, Kasba, Budhvar, Bhavani, Somvar, Ganesh, Nana, Shanvar, and Narayan wards. Brokers and wholesale grocers are chiefly Lingayat Vanis, and a few Gujarat Vanis and Marathas. Retail grocers are chiefly Gujarat Vanis, a few being Lingayat Vanis, Marathas, and Brahmans. They deal in sugar, clarified butter, spices, honey, and salt. Formerly salt was sold by a body of Lingayat Vanis, who lived in separate quarters called Mithganj or the salt market. Brokers and wholesale grocers are rich and retail grocers are well-to-do. They are hardworking, orderly, shrewd, and thrifty. In poor families, in the absence of men, women act as saleswomen. They send their boys to school.

Milk and Butter Sellers.

Milk and Butter Sellers numbering 315 are local Gavlis or cowherds, living chiefly in the Shukravar, Sadashiv, Ravivar, Kasba, Narayan, and Shanvar wards. They are Lingayats and Marathas. They keep ten to twenty-five she-buffaloes and about three or four cows. During the rainy season much butter is brought by Mavlis from the Mavals or West Poona hills. Gavlis are idle, quarrelsome, and thriftless. They have no capital, live from hand to mouth, and are often in debt. Their children graze cattle and their women hawk milk, curds, whey, and butter.

Liquor Sellers.

There are seventeen liquor shops in the city, ten country liquor shops and seven European liquor shops. Country liquor is sold by Maratha servants of the liquor contractor, and European liquor shops are kept mostly by Goanese Native Christians.

Cloth Sellers.

Cloth Sellers numbering 483 are chiefly found in the Budhvar, Ravivar and Shukravar wards. They are Hindus and Musalmans. The Hindus are chiefly Marwar Vanis and Shimpis and a few Bralimans and Marathas; and the Musalmans are mostly Bohoras. The Marwar Vanis live in Ravivar and are the largest traders. They do business both wholesale and retail and almost exclusively in the handmade cloth. They supply the rich. The Shimpis mostly live in Budhvar and chiefly sell bodicecloths. They also deal in poorer kinds of handwoven cloth. They supply the middle and low class demand. The Brahmans and Marathas, who mostly deal in handmade cloth, have their shops in Ravivar. The Bohoras live in the Bohoriali in Ravivar, and sell all kinds of European piece-goods as well as the produce of the Bombay mills. *Kinkhabs* or embroidered silks and coloured China and European silks are also sold by Bohoras. All the leading cloth merchants of Poona are men of capital and do a large business. Minor dealers work with borrowed capital. The profits vary greatly according to individual dealings, perhaps from £1 to £40 (Rs. 10-400) a month. Their women mind the house and their boys learn to read and write.

Shoe Sellers.

Shoe Sellers are all Chambers. Details are given under the head of Shoemakers. There are also some Pardeshi shoe sellers.

Ornament Sellers.

Ornament Sellers numbering 32S are mostly Gujarat Vanis, Sonars, Jingars, Kasars, Manyars, Lakheris, and a few Brahmans. Bralimans, Gujarat Vanis, and Sonars sell smaller silver and gold ornaments and have about fifty shops in Motichauk street in Aditvar. They are not men of capital, but their business yields them a comfortable living. Their women mind the house and their boys learn to read and write. Jingars make and sell queensmetal ornaments for the lower classes. Kasars and Manyars sell glass bangles and Lakheris make and sell lac bracelets and mostly live in the Kasba, Rastia, and Budhvar wards. The rich bangle sellers import China bangles from Bombay and sell them to retail sellers. They are well-to-do, their wives mind the house and their boys learn to read and write. Of the retail sellers, some have shops and some hawk bangles in streets. They are fairly off. Besides minding the house their women sometimes hawk bangles and their boys often learn to read and write. The Kasars are Jains and Marathas, and the Manyars are Musalmans of the Hanafi school. Lakheris, who seem to have come from Marwar during the time of the Peshwas, dress and speak like Marwar Vanis. They prepare lac bracelets for wholesale dealers by whom they are paid $\frac{3}{4}d.$ ($\frac{1}{2} a.$) the hundred. Some of them make bracelets on their own account and sell them at $6d.$ to $10\frac{1}{2}d.$ (4-7 as.) the hundred. Their women and their children after the age of fifteen help in the work. The more expensive jewelry, pearls, diamonds, and other precious stones are sold by individual jewellers who have not regular shops but whose houses are well known.

Animal Sellers.

Animal Sellers numbering 110 mostly live in the Bhavani Sadashiv and Vetral wards. The Poona cattle market is held in open ground at Bhambhurda village close to the west of the city. It is held on Wednesday and Sunday afternoons. Bullocks, buffaloes, cows, ponies, sheep, and goats are the animals dealt in. Although the chief, Dhangars are not the only, class who deal in cattle, neighbouring villagers and all men who have to sell their animals bring them to the markets.

Furniture sellers.

Except Jains, Kasars, and a few Brahmans and Sonars who sell but do not make brass and copper vessels, almost all the sellers of articles of native furniture, earthen pots, boxes, bedsteads, stools, carpets, and mats are makers as well as sellers. The brass and copper vessel sellers numbering 263 mostly live in the Ravivar, Ganj, Vetral, and Shukravar wards, and most of them have their shops in Ravivar. They buy from Tambats or employ Tambats to work for them. They are a shrewd, hardworking, and a prosperous class. Their wives do nothing but house work and their boys go to school. On Sundays and Wednesdays a market is held in the afternoon to the south and east of the Shanvar palace at which old furniture, books, pictures, clothes, lamps, glassware, and lumber are sold by

dealers from the cantonment bazar. Besides these markets in the Bhavani ward a number of Marwar Vanis deal in old furniture and lumber, and are comfortably off.

Miscellaneous Sellers.

The chief miscellaneous sellers are Bohoras who chiefly deal in hardware, stationery, and haberdashery, a few making and selling tin lanterns and tinpots and iron oil and water buckets. They have their shops in Ravivar. They earn £20 to £50 (Rs. 200 -500) a year and are comfortably off. They are neat, clean, hardworking, thrifty, and honest. Their wives mind the house and their boys go to school.

Husbandmen.

Husbandmen numbering 1636 are chiefly Kunbis and Malis, living mostly in the Kasba, Shukravar, Ganj, Mangalvar, Sadashiv, Shanvar, and Bhavani wards. Some till their own lands and some rent lands mostly belonging to Brahman landholders, They are sober and hardworking. Their women and children work with them in their fields.

Pulse Sellers

Pulse Sellers or *dalvalas* numbering 118 belong to two castes Marathas and Pardeshis. Maratha pulse-sellers numbering sixty-seven do not differ from Maratha grain-dealers. Pardeshi pulse-sellers numbering fifty-one came from Upper India to Aurangabad and from Aurangabad to Poona about sixty years ago. They buy pulse grain from wholesale pulse-grain dealers, prepare pulse, and sell it to retail dealers or private customers. They have no capital, and their own and have to borrow on the security of their stock. They spend as much as they earn. Their wives help them and their boys sometimes go to school.

Grain Roasters.

Grain Roasters numbering 223 mostly live in the Ravivar, Ganj, Bhavani, Vetar, Kasba, and Shukravar wards. They are chiefly Maratha and Pardeshi Bhadbhunjas. The Maratha Bhadbhunjas do not differ from Maratha husbandmen in appearance customs or way of living. The Pardeshi Bhadbhunjas are said to have come fifty years ago from Cawnpur, Lucknow, and Mathura in Upper India. They are proverbially dirty but hardworking. They buy the grain and pulse from grain-dealers, and after parching it sell it at a profit of twelve to twenty per cent. Their women and their children from the age of ten or twelve help them in their calling, sitting in the shop and soaking and drying grain. In spite of their help a grain-roaster's family does not earn more than £1 to £1 10s. (Rs. 10-15) a month. They send their boys to school. Competition among the different classes of grain roasters is said to be reducing their earnings.

Flower Sellers.

Flower Sellers or Phulmalis numbering eighty-nine have their shops in the Budhvar, Ravivar, and Vetar *peths* and in the Moti-chauk. Garden-owners let out beds of flower plants to Phulmalis. Women and children gather flowers and carry them in large shallow baskets to their shops where men string them into garlands and bouquets. Almost every Phulmali undertakes to supply certain families with flowers for house-god worship for which he is paid 6d. to 1s. (4-8 *as.*) a month. The flowers for house-god worship are of different kinds, are tied in small bundles in plantain leaves, and are taken to the houses of the customers in the evening by their women. The shop is arranged on wooden boards covered with a wet cloth. The Phulmali squats in the middle with an earthen water-pot on his left hand, baskets of flowers on the right hand, and ready-made garlands and nosegays arranged on wet cloth or hung in his front. The shop is about six feet wide and six feet long, and opens to the road. The flowers that remain after the day's sale are sold to perfume sellers who extract scents from them. The flower supply of Poona is so great that large quantities are sent to Bombay and as many as 1000 garlands and 3000 nosegays can be had at a few hours' notice.

Sweetmeat Sellers.

Sweetmeat Sellers numbering 234 mostly live in the Ravivar, Budhvar, Kasba, Shanvar, Vetar, Nana, Ganesh, and Shukravar wards. They are divided into Ahirs, Jains, Lingayats, Marathas, Marwar Vanis, Pardeshis, Shimpis, and Telis. The well-to-do have their shops and the poor hawk sweetmeats in streets. Their women help them in their work and their boys learn to read and write. They are hardworking, thrifty, and sober.

Oil Makers.

Oil Makers numbering 221 chiefly live in the Mangalvar, Ravivar, Sadashiv, Nana, and Vetar wards. They are mostly Marathas and Lingayats. The Maratha oil-makers are the same as cultivating Marathas and look and live like them, though they do not marry with them. The Lingayat oil-makers do not differ from other oilmen. They are said not to work on Mondays. They are hardworking, thrifty, sober, and strongly made, and their women are proverbially fair and well-featured. They extract oil from cocoanut, sesame, *Karla* *Verbesina sativa*, *kardai* *Carthamus tinctorius*, *undi* or oilnuts, groundnuts, and hemp seed. Their women help them and their boys from the age of twelve or fourteen. They earn 3d. to 1s. (2-8 *as.*). They suffer from the competition of kerosine and other imported oils and are falling to the position of labourers. Some of them send their boys to school.

Butchers.

Butchers numbering 131 mostly live in the Shukravar Rastia, Ganesh, Ravivar, Bhavani, and Nana wards. They are chiefly Musalmans called Sultani Lads. They are descended from local Hindu mutton butchers and ascribe their conversion to Haidar Ali of Maisur (1763 - 1782). They are hardworking thrifty and sober and some are rich, and spend much on marriage and other ceremonies. They marry among themselves and have a separate class union under a headman called the *chaudhari*. They have no connection with other Musalmans and eschew beef. They hold aloof from beef-butchers who are

only found in small numbers in the cantonment of Poona. They offer vows to Brahmanic gods and hold the usual Brahmanic festivals. The only specially Musalman rite is circumcision. None but the old women who sell the smaller pieces of mutton help the men in their work. They do not send their boys to school and take to no new pursuit. Except in Khatikali or Butcher's Bow near Subhansha in Ravivar ward, which is the oldest mutton market in the city and where they have their private stalls or sell in front rooms of their dwellings, butchers sell in one of the remaining five markets in Kasba, Vetel, Nana, and Bhavani wards and in Durjansing's Paga.

Fishermen.

Fishermen numbering 211 mostly live in the Kasba, Mangalvar, and Narayan wards. They are chiefly Bhois, of three divisions Kadus, Kamathis, and Marathas, of whom Kadus and Marathas eat together but do not intermarry. They are hardworking and thrifty but dirty, and the women are quarrelsome. A few send their boys to school, but as a class they are poor and show no signs of rising. The three fish markets are to the south of the Shanvar palace and in Aditvar and Vetel wards. In the open ground to the south of the Shanvar palace stalls are kept daily by Bhoi women for the sale of dry Konkan fish. The Aditvar ward fish market is chiefly used for the sale of salt fish, with fresh fish in the evening. In the Vetel ward fish market fresh fish and a little dry fish are offered in an open plot. Women of the Bhoi caste are the chief fish-sellers and Kunbis from the neighbouring villages are the chief consumers.

Stonecutters.

Stonecutters numbering seventy-six live in small numbers in all wards except in the Rastia and Muzafarjang, varying from one in Nyahal ward to eleven in Shukravar. They are Kamathis, Marathas, and Telangis; they do not eat together nor do they intermarry.

They are clean, hardworking, thrifty, and orderly. They are stone masons and carvers and make excellent images of gods and of animals, handmills, grindstones, and rolling-pins. As foremen or *mestris* they draw £1 10s. to £2 (Rs. 15 - 20) a month, and as day-workers 6d. to 1s. (4-8 *as.*). Their women do not help in their work, but boys of fifteen to twenty earn 14s. to 16s. (Rs. 7-8) a month. Some of them send their boys to school and on the whole they are a steady class.

Potters and Brick and Tile Makers.

Potters and Brick and Tile Makers numbering 291 live mostly in the Kasha, Nana, Narayan, Vetel, Ravivar, Bhavani, and Ghorpade wards. They are divided into Maratha and Pardeshi Kumbhars. Their houses can be known by pieces of broken jars, heaps of ashes, and the wheel. They make water vessels, grain jars, children's toys, bricks and tiles. Bricks are sold at 10s. to 18s. (Rs. 5-9) and tiles at 6s. to 10s. (Rs. 3-5) the thousand. Their women sell the smaller vessels and children's toys. They are hardworking, quiet, and well behaved. They do not send their boys to school and are poor.

Carpenters.

Carpenters numbering 598 mostly live in the Shukravar, Ravivar, Sadashiv, Kasba, Nana, Rastia, Somvar, Bhavani, and Ganesh wards. They are chiefly Badhais who are said to have come upwards of a hundred years ago from Jalna in the Nizam's country and from Burhanpur in West Berar. They are mostly Pardeshis from Upper India, and look like Pardeshis and speak Hindustani both at home and abroad. They are carpenters, and make boxes and cots and repair cupboards tables and chairs earning 1s. to 1s. 6d. (8-12 *as.*) a day. In Ravivar ward a street is called Badhaiali after them where they have their shops in which they sell boxes cots and children's toys.

Blacksmiths.

Blacksmiths numbering 358 mostly live in the Ravivar, Nana, Shukravar, Sadashiv, Kasba, and Bhavani wards. They are chiefly Maratha and Panchal Lohars and a few Ghisadis. Maratha Lohars say that they came, during the Peshwas' supremacy, from Ahmadnagar, Bombay, Khandesh, and Sholapur. They dress and look like Marathas. They are hardworking but thriftless, quarrelsome, dirty, and drunken. Their women do nothing but house work and their boys begin to learn at twelve; they are not helped by their women. The boy-workers are paid 1½d. to 6d. (1-4 *as.*) a day. The Panchal Lohars do not differ from Pannchal coppersmiths in food, drink, dress, and customs. They are hardworking but fond of liquor and not very thrifty. Ghisadis make horse-shoes and field tools, but are chiefly employed as tinkers. As a class they are hardworking, quarrelsome, dirty, thriftless, and fond of drink. Besides the blacksmith shops Poona city has twenty-seven iron pot factories in Aditwar ward, ten of which belong to Kunbis and ten to Malis, four to Telis or oilmen, and three to Bohoras. The workmen are chiefly Kunbis and Musalmans and a few Brahmans. The workers make little more than a living, most of the profits going to the dealers. Their women and children do not help the men in their work.

Bricklayers.

Bricklayers numbering 494 mostly live in the Budhvar, Nana, Sadashiv, Kasba, Shanvar, and Vetar wards. They are Gujarati, Jat, Kamathi, Lingayat, Pardeshi, and Musalman Gavandis. They are hardworking, even-tempered, sober, and thrifty. They are masons and contractors and the Hindu Gavandis also make clay images of Ganpati and other clay figures. Few send their boys to school. Some of them are rich and the rest are well-to-do.

Lime Burner.

Lime Burners numbering thirty-three mostly live in Shukravar ward. They are chiefly Lonaris who do not differ from Marathas in appearance, language, dwelling, food, or dress. They buy lime nodules from the neighbouring villages of Hadapsar, Mahammadvadi, Phursangi, and Vadki at 1s. 6d. to 2s. (Re.¾ -1) a cart. They burn the nodules, mixing them with charcoal and cowdung cakes in circular brick kilns which take three to six days to burn. As the work requires strength their boys do not help them till

they are sixteen. They send their boys to school. They complain that their calling is failing from the competition of well-to-do Parsis and Brahmans and of Mhars and Mangs.

Thatchers.

Thatchers numbering 118 mostly live in the Nana, Shukravar Muzafarjang, and Ganesh wards. They are chiefly Rajputs from Upper India, who came about a hundred and fifty years ago in search of work. The men dress like Marathas and the women wear a bodice a petticoat and a robe rolled round the petticoat with one end drawn over the head. They are quiet, hardworking, and orderly. They make thatch of *sag* or teak leaves hay and bamboos. The women sell firewood and cowdung cakes. Their calling is declining as Government do not allow thatched roofs to remain during the dry season. They do not send their boys to school and are a poor class.

Painters.

Painters numbering twenty-nine mostly live in the Ravivar Shukravar, and Budhvar wards. They are chiefly Jingars, who do not differ in food, drink, or dress and living from other Jingars.

Weavers.

Weavers are chiefly of two classes, cotton weavers and silk weavers. Poona city has about 500 cotton hand-loom, of which 450 belong to Hindus 300 of them Koshtis and 150 Salis, and the remaining fifty Musalmans. Most Hindus weave women's robes and Musalmans weave turbans. Cotton hand-loom weavers are chiefly found in the Somvar, Vetar, Bhavani, Rastia, and Shukravar wards. Hindu weavers are said to have come about three generations ago from Paithan, Yeola, Sholapur, Indapur, and Narayan Peth in the Nizam's country. The Musalman weavers came to Poona only four or five years ago from Malegaon in Nasik where they form a large colony. All live in one or two-storeyed houses, fifteen to twenty of which belong to the occupants, and the rest are hired. The robes woven by the Hindus and the turbans woven by the Musalmans are generally coarse and cheap. The Hindus work from seven to eleven and again from one to sunset; the Musalmans work almost the whole day except a short time for their meals which they generally cook in the same shed or room in which they weave. Both Hindu and Musalman cotton-weavers get great help from their women in reeling, dyeing, warping, and sizing. Some Hindu women even weave. With all this help cotton-weavers barely make a living. The average daily earnings of a cotton-weaver's family are said to range from 6d. to 7½d. (4-5 as.), and during the rains they are often short of work. All the yarn used in the Poona hand-loom is steam-made partly from the Bombay mills and partly from Europe. To buy the yarn most weavers have to borrow at two per cent a month. The local demand, especially during the marriage season will probably keep up hand-loom cotton-weaving for some time Still it seems probable that in a city where the price of grain and the cost of living is high compared with most parts of the Deccan the hand-loom weavers of robes will be driven out of a living by steam-made fabrics. Hand-loom

turban-weaving will probably last longer, as, so far, it has been free from machine competition.

Silk-weaving in Poona city is flourishing. Of 700 to 800 looms nearly two-thirds are owned by Momin and Julaha Musalmans who have settled at Mominpura in the Ganj ward. The Hindu silk workers are found in Kachi Ali and near Someshvar. Musalman silk workers belong to two sections Momins proper and Julahas, and the Hindu workers to three sections Khattris, Koshtis, and Salis. According to their own account most of the Musalmans came about three generations ago from Haidarabad, Dharwar, Narayan Peth, and Gulmatkal in the Nizam's country, and the Hindu workers, according to their own account, came from Paithan and Yeola three or four generations ago. As a class both Hindus and Musalmans are mild hardworking and sober, the Hindus being more hardworking and thriftier than the Musalmans. The demand for silk is growing and the workers are well-to-do. Their women and children over ten help the men in sorting, reeling, and sizing. Since the 1876-77 famine about twenty Kamathi Koshti families have come from Narayan Peth in the Nizam's country and settled at Poona. They own about 100 silk looms and are hardworking and more successful than the local workers. The only silk used is China silk. The Poona silk workers either borrow money from Shimpi and Marwar Vani silk dealers and buy silk yarn and gold thread, or they work as labourers, receiving the materials from Shimpi and Marwar Vani silk dealers and being paid by the piece. When money is advanced the silk dealers do not charge interest but get 1¼ per cent on the sale proceeds of the fabrics.

Gold and Silver Thread Makers.

Gold and Silver Thread Makers mostly live in the Shukravar and Aditvar wards. They are chiefly Lad Sonars, Konkani Sonars, Khandesh Sonars, Adher Sonars, and Vaishya Sonars, Lads proper, Marathas, and Pardeshis. About twenty-five families are Patvekaris or bar-makers, seventy-eight are Tarkasas or thread-drawers, and seventy to eighty families are Chapdyas or wire-beaters. There are also about 200 Valnars or thread-twisters mostly women. All Patvekaris or bar-makers are Sonars. Of the thread-makers or Tarkasas, the thread-beaters or Chapdyas and the thread-twisters or Valnars most are Ladds. The name Lad seems to point to a South Gujarat origin. But according to their own account they came to Poona from Aurangabad and Paithan in the Nizam's country. The Lads say their forefathers worshipped Parasnath and Balaji and afterwards, they do not know how long ago, they forsook the Jain faith for the worship of the goddess of Tuljapur. The rest are Kunbis and other classes, including a few Deshasth Brahmans, who took to thread-making because it was flourishing. They are a contented and hardworking class. They live generally in one-storeyed houses, some their own others hired. The different divisions of workers dress like other men of their own castes. As a class they are well-to-do. Except in twisting, gold and silver thread-makers get no help from their women nor from their children till they are over twelve. Most of the gold and silver used in making the thread is brought to Poona from Bombay by Marwar Vani and Shimpi dealers. There are about a hundred and fifty tape weavers. They are chiefly Ravals who have come from Mohol and Sholapur. They are permanently settled in Poona and visit their homes every year generally during the rains. In Poona they live in a part of the Ganj

ward which is known as the Raval quarter. They look like Lingayats and worship Shiv but do not wear the *ling*. Tape-weaving requires little skill. Most weavers are in debt to the tape-dealers, and they keep hardly any holidays. Besides them as many as 150 Musalman women weave narrow tape in their leisure hours earning a shilling or two a month.

Tailors.

Tailors numbering 481 mostly live in the Shukravar, Kasba, Budhvar, Ravivar, and Ganj wards. They are chiefly Namdev Shimpis, Konkani Shimpis, Jain Shimpis, and Pancham Shimpis who do not eat together nor intermarry. Most of the Namdev Shimpis dress like Brahmans and their women are proverbially handsome. They are hardworking, quiet, sober, and hospitable. They sew the clothes of their customers and also keep ready-made clothes in stock. They are helped by their women and by their children of fifteen and over. They send their boys to school but only for a short time. The use of sewing machines has much reduced the demand for their work; still as a class they are fairly off.

Leather Workers.

Leather Workers numbering 594 mostly live in the Nana, Ghorpade, Shukravar, Ganj, Bhavani, and Ravivar wards. Except a few Jingars or saddlers who sell horse-gear in Aditvar, they are chiefly Maratha Chambhars and Pardeshi Mochis. Maratha Chambhars live in one-storeyed houses with mud walls and tiled roofs. They are hardworking, dirty, and drunken. They work in leather, cut and dye skins, and make shoes, sandals, and water-bags. They sell shoes at 1s. to 3s. (Rs. $\frac{1}{2}$ - $1\frac{1}{2}$) and mend shoes at $\frac{3}{8}d.$ to $3d.$ ($\frac{1}{2}$ -2 *as.*) a pair. Their women help them. Some of them send their boys to school till they are about twelve when they become useful is their calling. They complain that they are growing poor because people are taking to wearing English-shaped boots and shoes still they are a steady if not a rising class. Pardeshi Mochis from the North-West Provinces and Oudh mostly live in Nana's ward. They make boots for the European and Native troops and for the residents of Poona cantonment which borders on Nana's ward. They are hardworking, dirty, and drunken but hospitable. They make and sell boots with elastic sides at 3s. to 10s. (Rs. $1\frac{1}{2}$ -5) the pair and shoes at 1s. $6d.$ to 3s. (Rs. $\frac{3}{4}$ - $1\frac{1}{2}$) the pair. They buy hides from Dhors. They earn $6d.$ to 1s. (4-8 *as.*) a day. Their women help by twisting thread. Their boys are skilled workers at fifteen or sixteen and earn $3d.$ to $4\frac{1}{2}d.$ (2-3 *as.*). They are said to be suffering from the importation of European shoes which are better and stronger than those they make.

Skin Dyers.

Skin Dyers numbering 124 mostly live in the Ravivar, Ganj, Nana and Bhavani wards. They are chiefly Hindu Dhors and Musalman Saltankars. The Hindu Dhors generally live in one-storeyed dirty houses and are known by their red fingers stained by the dye they use in making leather. As a class Dhors are dirty, hardworking orderly, thrifty, good-natured, and hospitable. Their principal and hereditary calling is tanning hides which they buy from Mhars. The women help the men in their work. In spite of good earning most of

them are in debt. Some send their boys to school where they remain till they are able to read and write. The Musalmans, who are said to have been descended from local Hindus of the Chambhar caste, trace their conversion to Aurangzeb. Both men and women are dirty and untidy and their women help the men in their work. They are hardworking and thrifty, and some of them are well-to-do and able to save. They buy goats' skins from butchers and dye them. Of late years rich hide and skin merchants, Mehmans from Bombay and Labhes from Bombay and Madras, through agents spread all over the country, buy and carry to Bombay the bulk of the local outturn of skins. This rivalry has ruined the Saltankars' calling, and most have given up their former calling. They have taken to making the coarse felt-like woollen pads which are used as saddle pads and for packing ice. They eschew beef and hold aloof from regular Musalmans. They do not send their boys to school.

Ornament Makers.

Ornament Makers numbering 683 mostly live in the Shukravar, Ravivar, Sadashiv, Kasba, Shanvar, and Ganesh wards. They are chiefly Deshi Sonars, Konkani Sonars, Ahir Sonars, and Panchals. The Deshi and Panchal Sonars are old settlers. The Konkani Sonars or Daivadnyas came from the Konkan and claim to be Brahmans. The Ahirs according to their own account came from Nasik about a hundred and fifty to two hundred years ago. All Sonars dress like Brahmans. They are clean, hardworking, even-tempered, and orderly, but have rather a bad name for not returning things ordered from them at the proper time. They are often accused of mixing gold and silver given to them for making ornaments. They make and mend gold and silver ornaments, set gems, and work in precious stones. They work to order and make 10s. to £2 (Rs. 5 - 20) a month. Their wives do nothing but house-work and their boys begin to help after ten or twelve and are skilled workmen at fifteen. They send their boys to school till they are from twelve and have learnt a little reading, writing, and counting. As a class they are well-to-do.

Brass and Copper Workers.

Brass and Copper Workers numbering 2320 mostly live in the Kasba, Shukravar, Vetar, Ghorpade, Budhvar, and Eastia wards. This number includes 810 Tambats or makers of large articles, 500 Jingars or makers of small articles, fifty Otaris or casters, and 960 Kasars or brasiers. The hereditary copper brass and bellmetal workers of Poona, the Tambats, Jingars, Otaris, and Kasars, are quiet easygoing people. All speak incorrect Marathi and live in one-storeyed houses of which seven belong to the Tambats, fifty or sixty to the Jingars, and thirty to the Otaris. The Kasars and Tambats dress like Brahmans and the Jingars and Otaris like Marathas. As the demand for brassware is growing, no Tambats, Jingars, Otaris, or Kasars have of late given up their hereditary craft. Within the last fifteen years their numbers have been more than doubled by local Maratha Kunbis whom the high profits of brass-working have drawn from the fields and the labour market, but who so far confine themselves to the rough parts of the work.

Basket Makers.

Basket Makers numbering 304 mostly live in the Nana, Bhavani, Ravivar, Ganesh, Ghorpade, Mangalvar, and Kasba wards. They are chiefly Buruds who say they came from Aurangabad, Ahmadnagar and Satara about two hundred years ago. They are divided into Jats, Kanadis, Lingayats, Marathas, Parvaris, and Tailangs who do not eat together nor intermarry. They look like Maratha husbandmen They are hardworking and orderly but fond of drink. They make baskets, mats, fans, cane-chairs and sun-screens, the women doing as much work as the men. Their average earnings are 10s. to 14s (Rs. 5 - 7) a month, and most families have at least two or three wage-earning members. They live in fair comfort but are poor They say their craft is falling as baskets are now made of iron instead of bamboo. They do not send their boys to school and do not take to new pursuits.

Barbers.

Barbers numbering 580 live in all the wards of Poona city, their number varying from seven in Rastia ward to ninety-four in Kasba ward. They are Nhavis who are divided into Gangatirkar, Ghati Gujarati, Khandeshi, Kunbi, Madras, Marwari, Pardeshi, Tailang Waideshi, and Vajantri Nhavis. They are a quiet orderly people hardworking but thriftless, showy, and fond of talk and gossip Besides being barbers they bleed and supply torches and their women act as midwives. At marriages they hold umbrellas over the heads of the bride and bridegroom. Besides this Gangatirkar, Kunbi, and Wajantri Nhavis act as musicians at marriages and other ceremonies and Khandeshi Nhavis act as torch-bearers. The rates charged by barbers of the different subdivisions vary little. A barber makes 14s. to £2 (Rs. 7-20) a month. Their women do not help except by acting as midwives and attending some rich women. They send their boys to school for a short time. They are steady and well-to-do, but none have risen to any high position.

Washermen.

Washermen numbering 479 mostly live in the Sadashiv, Shukravar, Kasba, Ravivar, Narayan, and Shanvar wards. They are Marathi Pardeshi and Kamathi Parits. They wash clothes. They are helped by their women and children in collecting clothes, drying them and giving them back to their owners. They do not send their children to school and are a steady class.

Labourers.

Labourers numbering 544 live in all the wards of the city except Muzafarjang. They are chiefly Bhandaris, Chhaparbands Kamathis, Kalals, Lodhis, Rajputs, and Raddis. When other Work fails the destitute of almost all classes take to labour.

Field Worker.

Field Workers numbering 569 mostly live in the Bhavani Shukravar, Sadashiv, and Nana wards. They are chiefly Kunbis Malis, and a few Mhars and Ramoshis. Some of them are yearly servants and some are paid every day.

Carriers.

Carriers numbering 483 mostly live in the Bhavani, Nana, Ganesh Budhvar, and Sadashiv wards and in small numbers in almost all wards. Carriers of bundles are chiefly Kunbis Telis and Musalman There is a special class of carriers known as *hamals*, who work in gangs, storing grain and unloading carts. They are paid a lump sum and every evening divide the proceeds. There is a considerable demand for labour on the railway and public roads. The workers are chiefly Mhars, Bhils, Kolis, Musalmans, and a few Kunbis.

Housebuilding causes a considerable demand for unskilled labour chiefly in making cement and helping the bricklayer and mason. Both men and women work as housebuilders. Every year, before the rains set in, tile-turning employs a large number of Kunbis and Marathas.

Players.

Players or Vajantris include Guravs, Nhavis, Ghadshis, and Holars of the Mang caste who play on a flute and a drum held in one hand; *Sarangivalas* or harpers and *Tablevalas* or drum-beaters who play for dancing girls, and, if Brahmans, perform in temples when the religious services known as *kirtans* are going on; and *tamashevalas*, Marathas and Brahmans who play the drum called *daphtamburi* or lute, and *tals* or cymbals. The only actors are the *Bahurupis*.

Animal Trainers

Of animal trainers there are the Garodis who go about with serpents, and the Nandivalas who have performing or misshapen bullocks.

Athletes,

Of Athletes, there are Kolhatis or acrobats, and Gopals who wrestle.

Depressed Classes.

The depressed classes include Chambhars, Dhors, Mangs, and Mhars. They live in dirty huts outside of the town. They are idle, dishonest, given to drinking, thieving, and telling lies. Both men and women are of loose morals and husbands and wives are changed at will. Of Mhars some are in the native army, some are domestic servants to Europeans, some are day-labourers, and some are sweepers. Labourers and scavengers begging for remains of dishes served at dinner and for a morsel of food, will remain crying at doors for hours together. Chambhars make shoes, Dhors tan hides, and Mangs make ropes and brooms. They live in abject poverty and have scarcely any bedding beyond a blanket. They go almost naked and have no metal pots in their houses. Their women work as day-labourers and do house work. They cannot read and write and seldom send their boys to the schools which Government have opened for them. To create a desire for learning in them small money and book presents are often made.

Religious Beggars.

Of 1798 beggars of five classes, 527 are Bairagis, 956 Gosavis, 297 Jangams, 15 Nanakshais, and 3 Kanphatas. Of these Gosavis are the most important class of beggars. They mostly live in Gosavipura, a street called after them where they own large mansions which they call *maths* or religious houses. They are beggars merely in name, many of them being traders and a few bankers. Except Sonars or goldsmiths, Sutars or carpenters, and other artisan classes and classes below Marathas, they recruit freely from all castes. They admit freely their children by their mistresses and children vowed to be Gosavis. They are divided into *gharbaris* or householders and *nishprahis* or celibates who eat together. Most of them are celibates in name and many of them have mistresses. As a class Poona Gosavis are clean, neat, hospitable, and orderly. Formerly Gosavis used to travel in armed bands pretending to seek charity, but really to levy contributions, and where they were Unsuccessfully resisted, they plundered and committed great enormities. Later on (1789) they were first employed by Mahadji Sindia in his army and afterwards by other great Maratha chiefs. [Grant Duff's Marathis, 7-8, 478-479.] Under the Peshwas they were great jewellers and shawl merchants and traded in rarities. In 1832 Jacquemont described them as bankers and traders all with a religious character. Though vowed to celibacy they were known to have *zananas* where their children were killed at their birth. They had most of the riches of Poona in their hands. They came chiefly from Marwar and Mewar and had adopted children of those countries. They had solid brick and stone houses pierced with a few narrow openings. [Voyage Dans Made, III 573,] Though all call themselves beggars and some live by begging, many live by trade and service. Many of them are moneylenders, and, though not so rich as before, are in easy circumstances and most of them send their boys to school.

Trade.

The trade of Poona has greatly increased since 1858, when it became a railway station. According to the 1881-1884 municipal returns imports of Poona city for the three years averaged 174,497 tons (4,885,922 Bengal *mans*) valued at £1,259,782 (Rs. 1,25,97,820) and the exports to 20,452 tons (572,642 Bengal *mans*) valued at £334,645 (Rs. 33,46,450). The following statement gives the chief details:

Rice.

Of grains the imports of rice average 9183 tons (257,134 *mans*) valued at £75,029 (Rs. 7,50,290) a year and the exports average 358 tons (10,013 *mans*) valued at £2864 (Rs. 28,640), leaving for Poona use 8825 tons (24,127 *mans*) valued at £72,165 (Rs. 7,21,650). Rice comes chiefly from Bhore and the *Maval*s or western hills of Poona. The rest comes from Kalyan and Panvel in Thana. From Bhore and West Poona rice is brought, chiefly by the growers on pack bullocks or in headloads; from Kalyan and Panvel it is brought by rail by local dealers. The chief rice markets are in the Narayan and Shukravard wards. To these markets rice is brought in large quantities especially on Monday and Thursday. Rice markets are held from the early morning till about ten. Rice is sold to Marwar and Maratha retail dealers, generally without the help of brokers. In selling them to the dealers, rice and other grains are always weighed by a third party called measurers or *mojnars* who are allowed a handful of rice for every 320 pounds (1 *palla* of 4 *mans*) weighed. Rice is the staple food of all classes, especially of Brahmans. In years of scarcity rice sometimes comes to Poona from Gujarat, Central India, and Bengal. From Poona rice is sent to Sholapur and Pandharpur, whose traders send agents to Poona to buy.

Bajri.

The imports of *bajri* average 15,059 tons (421,655 *mans*) valued at £77,449 (Rs. 7,74,490) a year and the exports 1038 tons (29,064 *mans*) valued at £5263 (Rs. 52,630), thus leaving for the city use 14,021 tons (392,591 *mans*) valued at £72,186 (Rs. 7,21,860). Besides locally from the eastern sub-divisions *bajri* comes from Vambhori in Ahmadnagar and from Phaltan in Satara. From Vambhori and Phaltan *bajri* is sent chiefly by the Marwar dealers of those towns. For *bajri* and other grains except rice the chief market is the broker's market in the Nana ward which is held from seven to ten in the morning. *Bajri* is sold through Marwari and Gujarat Vani and Maratha brokers who are paid 6d. (4 *as.*) for every 320 pounds (1 *palla* of 4 *mows*) of *bajri* sold; and the weigher as a rule is a Maratha, who is allowed a handful of *bajri* for measuring every 320 pounds. Most *bajri* dealers are Marathas and the rest Marwaris and Lingayats. *Bajri* is the staple food of all classes. It is ground into flour by women, kneaded with water into dough, and formed into thin circular cakes about twelve inches in diameter and one-eighth to one-third of an inch thick. These are first baked on iron pans, and, when dry, are thrust into red-hot cinders to complete the baking. The cakes are broken into pieces and either eaten in gruel or dry with onions or a relish of chillies, salt, and turmeric. From Poona *bajri* is exported by brokers. Since the opening of the Dhond-Manmad. Railway in 1878 *bajri* from Vambhori chiefly comes by rail and in small quantities by carts. In years of scarcity *bajri* also comes from Gujarat, Khandesh, and Jabalpur.

Indian Millet.

Indian millet or *jvari* imports average 3593 tons (100,613 *mans*) valued at £15,092 (Rs. 1,50,920) a year and exports average 619 tons (17,343 *mans*) valued at £2601 (Rs. 26,010) leaving for Poona use 2974 tons (83,270 *mans*) valued at £12,491 (Rs. 1,24,910).

The bulk of *the jvari* is grown locally, the rest comes from Sholapur and Satara. In the same way as *bajri*, *jrari* is sold in the broker's market. It is the staple food of the poor. It is ground into flour, kneaded, and baked into cakes like *bajri*.

Wheat.

Wheat imports average 8428 tons (235,952 *mans*) valued at £62,997 (Rs. 6,29,970) a year, and exports average 479 tons (13,408 *mans*) valued at £3794 (Rs. 37,940), leaving for Poona use 7949 tons (222,544 *mans*) valued at £59,203 (Rs. 5,92,030). Wheat comes largely from the Baleghat in the Nizam's territory and in small quantities from the northern sub-divisions of Ahmadnagar. From the Baleghat wheat is brought in carts to Dhond by Kharda and Shrigonda in Ahmadnagar; from Dhond it is chiefly brought to Poona in carts and in small quantities by rail. To find work for themselves and their bullocks in the hot season husbandmen generally prefer to bring wheat to Poona in carts instead of sending it by rail from Dhond. From the north of Ahmadnagar the wheat trade centres at Vambhori whence it is sent by local Marwar dealers to Poona. Wheat is occasionally brought by rail from the Berars, Gujarat, Jabalpur, and sometimes from Agra and Benares. Wheat is used sometimes daily but chiefly on holidays by the upper and middle classes and on holidays and great occasions alone by the poor. In the same way as *bajri* and *jvari*, wheat is sold in the broker's market through brokers.

Gram.

Gram imports average 4669 tons (130,723 *mans*) valued at, £24,549 (Rs. 2,45,490) a year and exports average 230 tons (6448 *mans*) valued at £1236 (Rs. 12,360), leaving for local use 4439 tons (124,275 *mans*) valued at £23,313 (Rs. 2,33,130). Except that it is largely given to horses, the details given for wheat apply to gram.

Groundnuts.

Of Groceries the imports of groundnuts average 2092 tons (58,584 *mans*) valued at £13,967 (Rs. 1,39,670) a year and the exports average 200 tons (5605 *mans*) valued at £1613 (Rs. 16,130), leaving for the city use 1892 tons (52,979 *mans*) valued at £12,354 (Rs. 1,23,540). Groundnuts are grown locally and come from Satara. Much of the local produce, about half the imports, is brought in shells and used by Hindus mostly on fast days. The nuts are baked in their shell or fried and eaten. Sometimes they are pounded mixed with raw sugar, and made into balls for eating. From about two miles round the city groundnuts are brought fresh every day and sold to retail dealers by Kachis or Malis who buy the standing crops from the growers. From long distances groundnuts come unshelled and are sold to Telis or oilmen through brokers in the same way as grain.

Cocoa Kernel and Cocoanuts.

The imports of cocoa-kernel and cocoanuts average 902 tons (25,249 *mans*) valued at £13,271 (Rs. 1,32,710) a year and the exports average 134 tons (3773 *mans*) valued at £2769 (Rs. 27,690), leaving for Poona use 768 tons (21,476 *mans*) valued at £10,502 (Rs.

1,05,020). Large quantities of cocoa-kernel and cocoanuts come by rail from Bombay and small quantities in carts from Mahad in Kolaba. Cocoanuts are chiefly sold by Maratha Naralvalas that is cocoanut-sellers and cocoa kernels by Gujarat Vani grocers. The Naralvalas are poor and trade on borrowed capital. The Gujarat Vanis are well-to-do. Besides as a condiment large quantities of cocoannts are offered to the gods and distributed to friends and relations at marriage and other ceremonies. Since the opening of the railway in 1858 the imports of cocoanuts have considerably risen and the price fallen by about twenty-five per cent.

Betelnuts.'

The imports of betelnuts average 218 tons (6120 *mans*) valued at £6375 (Rs. 63,750) a year, and the exports average forty-three tons (1207 *mans*) valued at £1372 (Rs. 13,720), thus leaving for Poona use 175 tons (4913 *mans*) valued at £5003 (Rs. 50,030). Betelnuts are imported by Gujarat Vani grocers from Bombay, Belari, and Dharwar. Betelnuts are offered to the gods and to friends and relations on a visit they are served by way of courtesy. After a meal all Hindus generally chew betelnut either with betel-leaf or tobacco.

Raw Sugar.

Raw sugar or *gul* imports average 5271 tons (147,583 *mans*) valued at £78,024 (Rs. 7,80,240) a year, and exports average 3148 tons (88,139 *mans*) valued at £46,020 (Rs. 4,60,200), leaving for Poona use 2123 tons (59,444 *mans*) valued at £32,004 (Rs. 3,20,040). [These returns must be increased by about ten per cent to represent the local produce which is not taxed,] Raw sugar comes in large quantities from the neighbourhood of Poona and from Satara, Poona, Kolhapur, and the Southern Maratha Country or the Bombay Karnatak. From Satara the growers themselves bring the raw sugar to Poona. From Kolhapur and the Bombay Karnatak the trade centres at Kolhapur whence the dealers send raw sugar to Lingayat brokers in Poona. In Poona the brokers either sell it to local Gujarat Vani dealers or consign it to Gujarat and up-country stations, to which the bulk of the exported sugar goes. At present (1884) all raw sugar comes in carts. After the opening of the West-Deccan or Poona-Londa railway, probably in 1889, this raw sugar, instead of going through Poona, will be sent direct to Gujarat and other places and Poona imports and exports will considerably fall.

Sugar.

Sugar imports average 1279 tons (35,814 *mans*) valued at £40,095 (Rs. 4,00,950) a year, and exports 329 tons (9205 *mans*) valued at £10,352 (Rs. 1,03,520), leaving for Poona use 950 tons (26,609 *mans*) valued at £29,743 (Rs. 2,97,430). Sugar is chiefly brought from Bombay by local Gujarat Vani dealers. Coarse sugar is also brought in small quantities from Kolhapur and the Bombay-Karnatak. The well-to-do and middle classes generally use sugar and the poor raw sugar.

Clarified Butter.

The imports of clarified butter average 798 tons (22,336 *mans*) valued at £59,276 (Rs. 5,92,760) a year, and the exports average 81 tons (2272 *mans*) valued at £5948 (Rs. 59,480), leaving for Poona use 717 tons (20,064 *mans*) valued at £53,328 (Rs. 5,32,380). Besides locally from the *Mavals* or western hills, clarified butter comes from Barsi in Sholapur, Athni in Belgaum, and the Sangli State. From the west the cattle owners themselves bring clarified butter to Poona, and from other parts it is chiefly imported by local Gujarat Vani dealers. The export is small.

Tobacco.

Tobacco imports average 848 tons (23,733 *mans*) valued at £16,606 (Rs. 1,66,060) a year, and exports average 121 tons (3378 *mans*) valued at £2358 (Rs. 23,580), leaving for Poona use 727 tons (20,355 *mans*) valued at £14,248 (Rs. 1,42,480). Tobacco comes in carts chiefly from Belgaum, Dharwar, Kolhapur, and Miraj. Poona has two or three Lingayat merchants who import large quantities of tobacco and sell it to retailers and makers of snuff. Tobacco is smoked made into snuff and chewed with betelnut and leaves. Before it is exported, tobacco is partly pounded into snuff by Brahman dealers and partly cut dressed and spiced for chewing by Brahman and Lingayat dealers. Poona snuff finds a market in Northern India, as far as Benares, and the dressed tobacco for chewing goes all over the Bombay Presidency. Of the total exports of 727 tons (20,355 *mans*) valued at £14,248 (Rs. 1,42,480), about 121 tons (3393 *mans*) valued at £2341 (Rs. 23,410) go as snuff and 606 tons (16,962 *mans*) valued at £11,907 (Rs. 1,19,070) go as dressed tobacco for chewing. As the tobacco is either pounded into snuff or dressed for chewing before it is sent from Poona, it is probable that the trade will increase after the opening of the West Deccan Railway.

Vegetables.

According to the city octroi returns, for the three years ending 1883-84, the imports of green vegetables averaged 12,508 tons, (350,233 *mans*) valued at £21,890 (Rs. 2,18,900), and the exports averaged 618 tons (17,295 *mans*) valued at £1081 (Rs. 10,810). To this must be added at least an equal amount of imports and exports of vegetables, which, being grown within municipal limits and carried in headloads, are free from the municipal tax. Green vegetables and fruits are grown in about 2000 acres of garden land within five miles of Poona. The growth of green vegetables and fruits has largely increased since the opening of Lake Fife and the Mutha Canal (1875-1879). The vegetable growers are Kachis and Malis who sell standing crops to wholesale dealers, chiefly Kachis, Marathas, Malis, and Bagvan Musalmans. To retail dealers vegetables are sold through Maratha and Mali brokers called *dalals* or *dandivalas*, who, besides a handful of vegetables, are paid 1½d. to 6d. (1-4 *as.*) on every sale of 320 pounds (1 *palla* of 4 *mans*) Vegetables are eaten daily by all classes. The exports, which date from the opening of the railway in 1858, are almost all to Bombay.

Betel Leaf.

Betel-leaf imports average 2160 tons (60,470 *mans*) valued at £32,321 (Es. 3,23,210), and exports average 1342 tons' (37,555 *mans*) valued at £20,090 (Es. 2,00,900), leaving for Poona use 818 tons (22,915 *mans*) valued at £12,231 (Es. 1,22,310). The growers of betel-leaves are mostly Tirgul Brahmans and a few Marathas, and the sellers, who are called Tambolis, are mostly Musalmans and few Marathas. A betel-leaf shopkeeper offers for sale betel-leaves betelnuts, slaked lime, catechu, and tobacco. Betel-leaf is eaten by all classes as a dessert after food. A couple of leaves with a little lime rubbed on with the finger to the back of each leaf, a quarter of a betelnut, and catechu are chewed together, and in addition to the some chew tobacco. The leaves are cured before being eaten Poona is known as having the best cured leaves in the Deccan.

Fresh leaves are harsh and bitter. To remove the harshness the leaves are kept closely packed till the sap dries when the leaf grows soft and gets a shining yellow. Betel-leaf is largely sent to Bombay

Fish.

Imports of dry and salted fish average 620 tons (17,373 *mans*) valued at £6949 (Rs. 69,490). Of this, as an article of trade only sixty-four tons (1900 *mans*) valued at £720 (Rs. 7200) are sent to Bhor. Of the rest about 556 tons (55,737 *mans*) valued at £6229 (Rs. 62,290) are locally sold in small quantities to the people of the *Mavals* or western hills, and as much is used by the city people. Fish is imported from Bombay and the Konkan, mostly by two large traders, and in small quantities by a few local Bhois. The retail sellers are Bhoi and Musalman women. Fish is eaten by Musalmans and by all flesh-eating Hindus.

Fodder.

Of food for animals, fodder imports average 30,726 tons (860,334 *mans*) valued at £21,508 (Rs. 2,15,080) a year, all of which is used in Poona. 3977 tons (111,344 *mans*) valued at £2784 (Rs. 27,840), shown under exports in the above statement, are fodder passed free of duty from Government grass-lands or *kurans* for Government cattle and horses. Of fodder grass comes from Government forest and pasture reserves and neighbouring villages, and millet and other straw from a distance of twenty-four miles round Poona. The chief fodder markets are held in the north and west of the city where the growers sell fodder through Maratha brokers who are paid 6d. (4 *as.*) for every cart-load.

Chaff.

Imports of chaff oil-cake and cotton seed average 1169 tons (32,737 *mans*) valued at £3040 (Rs. 30,400) a year, and exports average eighty-eight tons (2468 *mans*) valued, at £265 (Rs. 2650), leaving for Poona use 1081 tons (30,269 *mans*) valued at £2775 (Rs. 27,750). Of these chaff and husks come from West Poona or the *Mavals* where rice is largely grown; oil-cake comes from the east from Sirur and latterly from Gujarat; and cotton seed comes from the south and east. Generally the growers bring these articles to

Poona where they are bought by milkmen and other consumers. The exports are chiefly to neighbouring villages by well-to-do people who keep milch cows and buffaloes.

Firewood.

Of fuel and lighting materials firewood imports average 29,599 tons (828,771 *mans*) valued at £34,529 (Rs. 3,45,290) a year; this import is all used in Poona. About 809 tons (22,646 *mans*) valued at £990 (Rs. 9900), shown under exports in the statement, are the firewood used in the cantonment which lies outside of municipal limits. The main imports of firewood are *babhul* wood from the east and the poorer classes of trees chiefly from Government forests in the west of the district and from the Bhore state. The firewood of the Government and Bhore state forests is yearly leased by wholesale Maratha timber dealers of Poona who sell it to Maratha petty dealers in the city. From other parts standing trees are bought by Maratha petty dealers and sometimes by *Mhars* who fell and bring the wood to the city. During the last twenty years, as the supply is short of the demand, the price of firewood has steadily risen.

Charcoal.

Charcoal imports average 2461 tons (68,899 *mans*) valued at £5167 (Rs. 51,670), a year. The exports are small. The charcoal dealers are *Lonaris* who buy wood in the forest, make it into charcoal, and import the charcoal into the city on hired pack bullocks, mules and ponies. Charcoal is largely used by blacksmiths, copper-smiths and other metal-workers. During the last twenty-five years, as the district is bare of forests, the price of local charcoal has so greatly risen, that the large metal factories have to use coal and coke.

Trade

Imports of oilseeds average 848 tons (23,737 *mans*) valued at £5134 (Rs. 51,340) a year. Oilseeds come chiefly from the Poona district and are sold in the same way as *bajri* and other grains. The exports are small.

Oil.

Imports of oil other than kerosine average 1363 tons (38,164 *mans*) valued at £35,688 (Rs. 3,56,880) a year, and exports average 523 tons (14,632 *mans*) valued at £13,704 (Rs. 1,37,040), thus leaving for the city use 840 tons (23,532 *mans*) valued at £21,984 (Rs. 2,19,840). Imports of kerosine oil roughly average 810 tons (22,650 *mans*) valued at £7930 (Rs. 79,300) a year. Groundnut, safflower and sesame oil is brought from Indapur and Sasvad in Poona, from Barsi in Sholapur, and from Satara; and coconut oil and kerosine from Bombay. Large quantities of oil are pressed in Poona by Hindus of the Teli caste.

Bricks.

Of building materials imports of bricks and tiles average 8991tons (251,758 *mans*) valued at £3619 (Rs. 36,190) a year. Bricks and tiles are made by local potters in the outskirts of the city.

Stone.

Imports of cut-stone, chiefly quarried in the neighbouring hills, average 3426 tons (95,922 *mans*) valued at £1881 (Rs. 18,810) a year.

Lime.

Imports of lime, which is baked in the outskirts of the city, average 3061 tons (85,696 *mans*) valued at £3304 (Rs. 33,040), and; exports, which are chiefly to Kirkee, average 2112 tons (59,162 *mans*) valued at £2281 (Rs. 22,810).

Timber.

Timber imports average 5703 tons (159,673 *mans*) valued at £43,256 (Rs. 4,32,560), and exports which are chiefly to neighbouring villages and Kirkee average 299 tons (8378 *mans*) valued at £2410 (Rs. 24,100). Of timber Maulmain teak comes from Bombay. Of local teak the large logs come from Nasik and the rafters from Thana; junglewood comes from the *Mavals* or West; Poona hills and Bhor, and *babhul* wood from twenty-four miles, round Poona. The large trade with Bombay and Thana is in the hands of Konkan and Cutch Musalmans who trade on their own capital Other petty timber dealers are Marathis who trade on capital borrowed at high interest.

Bamboos.

Bamboo imports average 1204 tons (33,716 *mans*) valued at £3631 (Rs. 36,310) a year. Split bamboos fit for roofs an brought from Bombay by large Musalman timber dealers; and green bamboos fit to make baskets and matting are brought from the *Mavals* or western sub-divisions by villagers and sold either the Maratha timber dealers or to Buruds or basket-makers.

Drugs and Spices.

Imports of drugs and spices average 2313 tons (64,762 *mam* valued at £67,867 (Rs. 6,78,670) a year. Drugs and spices are chief brought by Gujarat Vani grocers from Bombay.

Piece Goods.

Piece-goods imports average 1696 tons (41,497 *mans*) valued at £255,834 (Rs. 25,58,340) a year, and exports average 702 tons (19,667 *mans*) valued at £113,550 (Rs. 11,35,500). Of handmade cotton cloth coarse waistcloths or *dhotars* and robes or *sadis* are brought from Sholapur by Shimpis, and fine waistcloths and robes are brought by

Marwar Vanis from Nagpur and Dharwar or Narayan Peth in the Nizam's territories and sometimes from Benares in North India, and Salem and other parts of Madras. Steam-made cotton piece-goods, both of English and of Bombay make, were formerly brought by Bohoras and are now also brought by Brah-mans and Marathas. Of late the use of Bombay-made cloth has greatly increased. Foreign silks, brocades, and woollen cloth are brought by Bohoras from Bombay, and country blankets are brought by Sangars from Sholapur. Besides these imports a large quantity of coarse cotton robes and waistcloths and richly embroidered silk cloths are locally woven. The exports are consigned direct, chiefly to Satara and other southern districts. After the opening of the Poona-Londa Railway this export trade, instead of probably passing through Poona, will go direct and the Poona trade will fall considerably.

Metal

Metal imports average 3541 tons (99,157 *mans*) valued at £174,643 (Rs. 17,46,430) and exports average 1002 tons (28,067 *mans*) valued at £61,966 (Rs. 6,19,660). The exports include only metal sheets and do not include the brass and copper vessels which, average about eighty per cent of the metal sheets imported. The imports have been steadily increasing. In 1882-83 they were about twenty per cent above the average or worth £250,000 (Rs. 25 *lakhs*). The working into vessels adds about twenty-five per cent to the value of the metal. So that the value of the exported ware may be roughly estimated at £240,000 (Rs. 24 *lakhs*). During the last twenty-five years the metal trade of Poona has steadily grown. Poona has displaced Ahmadnagar which used to be the chief metal mart in the Deccan, and supplies are now sent not only over the whole Deccan, but also to the Berars, Khandesh, and the Nizam's territory. The finer vessels of Nasik and Sangli are rivalled by the Poona wares. Even in the finer articles, in a few years Poona will probably displace Nasik and Sangli. Of metals Europe-made copper, brass, and iron are largely brought from Bombay by Gujarat Vanis. To make vessels Gujarat Vanis employ local Kasar Tambat and other craftsmen. The making of brass and copper vessels gives work to about 3000 men who are paid either monthly or by the piece. The original workers came from Ahmadnagar. Lately, owing to the thriving trade, many Marathas and others have taken to this craft and several Gujarat Vanis have grown rich.

Cotton.

Of articles freed from municipal taxes, cotton imports for 1882-83 were 124 tons (680 *mans*) valued at £884 (Rs. 8840) and exports were 213 tons (5974 *maws*) valued at £7766 (Rs. 77,660). The imports are chiefly from the south-east of the district where cotton is grown. Most of the cotton dealers are Gujarat Vanis.

Dye Roots.

Imports of dye roots, barks, and other colouring materials for 1882.-83 were 131 tons (3670 *mans*) valued at £367 (Rs. 36,700) and exports were 315 tons (8818 *wans*) valued at £882 (Rs. 8820). These articles are gathered in the forests and brought to the market by

the hill people of West Poona and sold to Gujarat Vani grocers. In this trade the grocers make a cent per cent profit.

Dried Fruit

Imports of dried fruit for 1882-83 were 680 tons (19,028 *mans*) valued at £15,222 (Rs. 1,52,220) and exports 461 tons (12,900 *mans*) valued at £10,318 (Rs. 1,03,180). Of dried fruit, dried plantains are brought from Bassein in Thana by Gujarat Vanis and dried figs, pomegranates, grapes, and other fruits are brought from Arabia, Persia, and Kabul by Baluchis and Kabulis. The exports are chiefly to Ahmadnagar, Sholapur, Satara, and the Bombay Karnatak.

Glass.

Imports of glassware and glass bangles for 1882-83 were 272 tons (7604 *mans*) valued at £3820 (Rs. 38,200), and exports were thirty-one tons (854 *mans*) valued at £427 (Rs. 4270). European glass-ware is brought from Bombay by Bohoras. Of bangles China-made cut bangles come from Bombay, and country bangles from the village of Velu on the Poona-Belgaum mail road about twelve miles south of Poona. The bangle-sellers are Kasars. The exports are chiefly to neighbouring villages.

Hides and Horns.

Imports of hides and horns for 1882-83 were 134 tons (3574, *mans*) valued at £4485 (Rs. 44,850), and exports were 622 tons (17,427 *mans*) valued at £20,909 (Rs. 2,09,090). Hides and horns are brought by village Mhars from neighbouring villages and sold to Saltankars and Dhors. From Poona Saltankars and Dhors export; hides and horns to Bombay. Three or four unsuccessful attempts have been made by Bombay merchants to start tanneries at Poona, and the tanneries which were built are now in ruins.

Salt,

Salt imports for 1882-83 were 429 tons (12,010 *mans*) valued at, £3002 (Rs. 30,020) a year. Little is exported. Salt is brought by Gujarat Vani grocers from Bombay.

Stationery.

Imports of stationery for 1882-83 were 189 tons (5286 *mans*) valued at £52,860 (Rs. 5,28,600) and exports were 85 tons (23911 *mans*) valued at £23,900 (Rs. 2,39,000). Stationery is brought from Bombay by Bohoras, Marathas, and lately by Brahmans. The exports do not change hands in the city, but pass through Poona on the way to Satara and other southern districts.

Twist.

Imports of machine-made twist for 1882-83 were 472 tons (13,210 *mans*) valued at £2642 (Rs. 26,420). Twist is brought from Bombay by Marwar Vanis and is generally sold to local weaves. Large quantities are used in thread-making factories lately started by Brahman capitalists and worked by Maratha boys.

Smoking Hemp.

Of intoxicating articles imports of smoking hemp or *ganja* for 1882-83 were twenty tons (560 *mans*) valued at £406 (Rs. 4060) and exports were six tons (170 *mans*) valued at £120 (Rs. 1200). Smoking hemp comes from Ahmadnagar and Sholapur. The right to sell it is yearly farmed to one dealer. *Ganja* is smoked chiefly by Gosavis and ascetics. The exports are chiefly to neighbouring villages.

Opium.

Opium imports for 1882-83 were two tons (seventy *mans*) valued £5530 (Rs. 55,300). Opium is supplied by Government to the farmer to whom the right of selling opium is yearly sold. Opium is smoked and eaten chiefly by Musalman Fakirs or ascetics.

Country Liquor.

Imports of country liquor for 1882-83 were 495 tons (13,870 *mans*) valued at £55,480 (Rs. 5,54,800), and exports were 127 tons (3570 *mans*) valued at £14,280 (Rs. 1,42,800). This liquor is supplied by the central distillery established at Mundhave about eight miles east of Poona. The right of selling country liquor is yearly sold to the highest bidder. The exports are chiefly to neighbouring villages.

European Liquor.

Imports of European liquor for 1882-83 were 610 tons (17,090 *mans*) valued at £102,540 (Rs. 10,25,400), and exports were fifty-one tons (1432 *mans*) valued at £8592 (Rs. 85,920). European liquor is brought from Bombay by Parsis and Europe shopkeepers. It is chiefly used by Hindus in the city and by Christians and Parsis in the cantonment. The exports go chiefly to Satara and the Bombay Karnatak.

Crafts.

Of about 25,000 craftsmen about half the number are capitalists and the rest work as labourers. The chief Poona city crafts are the making of copper and brass vessels, the weaving of silk and cotton cloth, the making of gold and silver threads, glass bangles, ivory combs, clay figures, iron pots, felt and paper, tape-weaving, and wood-turning. As Poona city is the great centre, almost the only seat of these crafts and industries, the details have been given in the chapter on trade and crafts.[See Part II. pp. 173-210.]

Markets,

Poona City has twenty-six markets. Of these five are vegetable markets, six are mutton markets, three are fish markets, one is a fuel market, two are fodder markets, and nine are grain markets. The five vegetable and fruit markets are, the Mandai or market to the north of the Shanvar Palace, the Kotval Chavdi or police office in Budhvar ward, and three Bhajialis or vegetable rows one in Vetar ward and two in A'ditvar ward, a larger near Durjansing's Paga, and a smaller to the east of Moti Chauk or Pearl Square. In addition to these, on a suitable site in the Shukravar ward, a large central market is (1884) being built.

Mandai.

The largest and most popular market in Poona is the Mandai, the fruit and vegetable market to the north of the Shanvar Palace. It is held in an open space 166 yards by 45 which was originally set apart for the retinues of the Peshwas and their nobles in state or festive gatherings. This space and the narrow belt all round the palace wall between its bastions have been levelled and sanded and laid out in paths and rows of stalls. The stalls are four to six feet square and the paths six to ten feet wide. A road running north and south divides the Mandai proper, that is the large space to the north of the palace into an eastern and a western half. The eastern half has been set apart for fruits and green vegetables, and the western half for fruits, vegetables, root vegetables, and miscellaneous articles. The northern third of each half is set apart for brokers and wholesale dealers, and the two southern thirds are allotted to petty stall keepers. From four to seven in the morning Kunbi and Mali carts laden with vegetables, lemons, figs, oranges, groundnuts, potatoes, and other field and garden produce come from the villages and gardens round Poona to market and are ranged in rows on the ground set apart for wholesale dealers.

The wholesale dealers, who are Kachis or market-gardeners of Upper Indian origin and Marathas, buy the daily arrivals soon after they come to market and dispose of them in small lots to retailers who carry them to their stalls and sell them to users. The market hours are six to eleven in the morning. Among the middle classes home supplies are bought by the male heads of families. Among the lower classes the women generally come and the higher classes send their servants to buy supplies. As soon as their morning wholesale purchases are over, the wholesale dealers daily send in wicker baskets large quantities of potatoes, onions, chillies, and leaf vegetables, the produce of gardens within twenty miles of Poona, to Bombay, Sholapur, and the Nizam's country. These dealers have agents in Bombay, or are themselves agents to Bombay dealers, to whom they consign the produce. Besides the wholesale dealers another class of middlemen, the brokers or *dalals*, bargain for buyers and sellers and weigh the articles for a fee. The scale on which the wholesale traders deal varies greatly, some of them being large traders and men of capital. The brokers make 2s. to 4s. (Rs. 1-2) a day and spend all their earnings. The retail sellers, who seldom have capital, borrow 4s. to 10s. (Rs. 2-5) from moneychangers for the day at an interest of $\frac{1}{2}$ *anna* the rupee, make their purchases, and, after selling them retail, return the lender his money with interest. Their daily profits vary from 6*d.* to 1*s.* (4 - 8 *as.*). When the retail stallholder has bought his day's supplies, he or she, for as many women as men sell, spreads on the ground a mat or a piece of sacking, and, on the sacking, lays the articles either in baskets or in heaps and sits among the

baskets with a pair of scales close at hand. These retail dealers are chiefly Kachis and Malis who are Hindus, and Tambolis who are both Hindus and Musalmans. The Kachis chiefly sell fruit, the Malis both fruit and vegetables, and the Tambolis seldom anything but betel-leaves and tobacco. On the east side of the Palace gateway, between the bastions, in a row next the road, Musalman Atars deal in the coloured powders which are used in making brow-marks, and in incense and perfumery. They arrange their wares in small heaps on metal plates laid on wooden stools. Over their wares, as a sunshade, they open a large umbrella or stretch a cloth on poles. They bring their stores daily to market on their heads and carry back what remains unsold. They make their goods at home from raw materials which they buy from grocers. Behind the Atars two rows of Maratha Vani women sell three varieties of grass-seeds, *devbhat rajgira* and *vari*, groundnuts raw sugar, salt, and articles eaten on fast days.[The botanical names of two of the three grass seeds or early that is primeval grains are *rajgira* *Amaranthus polygamus*, and *vari* *Coix barbata*.] Behind these stalls, in a row against the Palace wall, sit a few grocers or Nestis whose chief wares are assafaetida, cinnamon, cloves, cocoanuts, coriander, cumin-seed, pepper, sesame, spices, and turmeric. To the east of the perfumers and grass-seed sellers sit a few Malis and Brahmans who sell plantain-leaf dining plates; further east a few Gurav or priestly Maratha women sell *patravals* or dry leaf platters, of six or ten leaves of the *palas*, banian, and other large-leaved trees stitched together round a centre leaf. Behind the Gurav platter-sellers are cocoanut-sellers or Naralvals. The shroffs or moneylenders and changers, all Deshasth Brahmans, sit with a heap of copper coins and cowrie-shells piled on a small cloth stretched before them. They squat in threes and fours as near the retail sellers as possible. Besides the interest on daily cash advances to petty dealers they earn 6*d.* to 9*d.* (4-6 *as.*) a day from changing copper for silver and shells. In all transactions under $\frac{3}{8}$ *d.* ($\frac{1}{4}$ *a.*) cowrie or *kavdi* shells are used, eighty to ninety-six shells going to the quarter anna. The shells are counted with notable speed in sets of four. The ground between the bastions to the west of the eastern gate is held by a row of vegetable dealers fronting the road, chiefly Malis who sell their garden produce retail instead of parting with it wholesale in the morning. Behind the Malis are two rows of garlic tamarind onion and other relish sellers; and behind these again, touching the wall, sit dealers in chillies who are specially kept to this out-of-the-way place to avoid the nuisance which chillies cause when exposed to the sun and wind. The wholesale dealers carry on their business in the open air and generally finish their work before the sun gets strong. The retail dealers either open a large umbrella or stretch a cloth over their stalls to shelter themselves and their wares from the sun and rain. The dealings in green vegetables are carried on under the shade of one or two large banian trees in the north-west of the open space. The narrow strip of ground along the east of the palace wall, between the first two bastions from the north-east corner, is occupied by a front row of dealers in haberdashery; by a middle row of dealers in tobacco and spices; and in the space close under the wall by rope-selling Mangs. The space between the bastions further south is allotted to basket-makers, potters, dealers in old iron, old brass and copper vessels, and old furniture. The basket-makers or Buruds live in the houses across the road from their stalls. The potters store their wares in rented houses. Most of the dealers in ironware are Bohoras. On the south side of the palace, on the strip of ground to the east of the centre bastion, shoemakers and fisherwomen of the Bhoi caste sit in two lines facing each other. Only dry fish brought from the Konkan are sold here; fresh river fish are sold

from door to door. The space to the west of the centre bastion is empty and is set apart as a carriage stand. On the west side of the palace, the strip of land to the south of the centre bastion is the grass market where bundles of green and dry grass and stalk fodder are stored. The trade in stalk fodder and, dry grass is brisk, the dealers making 1. to 2s. (Re. $\frac{1}{2}$ - 1) a day. Green grass is brought by villagers-from twelve miles round in head-loads and is offered for sale at $2\frac{1}{4}d.$ to $4\frac{1}{2}d.$ ($1\frac{1}{2}$ - 3 *as.*) a load. The strip of land to the north of the centre bastion is held by dealers in firewood and cowdung-cakes about ten inches across and one inch thick. The firewood is cut in thirty pound ($\frac{3}{4}$ *man*) faggots worth 6d. to 1s. (4 - 8 *as.*). The cowdung-cakes are piled in small heaps and sold at $\frac{1}{8}d.$ to $\frac{1}{16}d.$ each (3-6 for $\frac{1}{4}$ *a.*). A few timber-dealers buy trees in the villages round Poona, cut them, and dispose of the fuel in the city at a large profit. On an average fairweather day in 1882, of all kinds of produce 185 cart-loads weighing about seventy-nine tons (2220 *mans*) and worth about £210 (Rs. 2100) were brought to the Mandai. Of the whole amount sixty cart-loads weighing about twenty-six tons (720 *mans*) and worth £90 (Rs. 900) were vegetables; twenty cart-loads weighing about nine tons (240 *mans*) and worth £60 (Rs. 600) were fruit; ten cart-loads weighing about four tons (120 *mans*) and worth £5 (Rs. 50) were firewood; eighty cart-loads weighing about thirty-four tons (960 *mans*) and worth £40 (Rs. 400) were fodder; and fifteen cart-loads weighing about six tons (180 *mans*) and worth £15 (Rs. 150) were miscellaneous. On holidays and fast days specially large quantities of sweet potatoes or *ratalas* and earthnuts or *bhuimugs* are generally sold. Oil Sundays and Wednesdays a market is held in the afternoon to the south and east of the Shanvar palace at which old furniture, books, pictures, clothes, lamps, glassware, and lumber are sold by dealers from the cantonment bazar. On these days also villagers from the country round bring poultry and eggs, and carpenters bring stools, churns or *ravis*, pestles or *musals*, and two varieties of dishes called *kathvats* and *padgas*. Upto 1862 the space to the north of the palace was used for the half-weekly' cattle-market which is now held in the village of Bhamburda across the Mutha to the west of the city. The Mandai market is open every day in the year. Holidays are busier rather than slacker than other days. The market is over by noon when the municipal sweepers and water-carts come and sweep and water the ground for next morning. Of the four smaller vegetable and fruit markets, that held in the Kotval Chavdi or police office in Budhvar ward is in a large building once the property of Government which in 1845 was sold to a private person. The three Bhajialis or vegetable rows, one in Vetal ward and two in Aditvar ward, are open markets where the dealers squat at the side of the street or in house verandas. All these four smaller markets are open throughout the day. The dealers, who are Kachis and Malis, buy their stocks at the Mandai market in the early morning and sell at their stalls to consumers.

Mutton.

Of the six mutton markets, one in Kasba ward has twelve stalls, one in Khatikali or Butchers' row near Subhansha in Ravivar ward has fourteen stalls, one in Durjansing's Paga in Ravivar ward has forty-eight stalls, one in Yetal ward has sixteen stalls, one in Bhavani ward has six stalls, and one in Nana ward has sixteen stalls. The mutton markets in Kasba, Yetal, Nana, and Bhavani wards have been built by the Municipality since 1877. The market in Durjan-sing's Paga is a large quadrangular private building hired by

the Municipality and let to butchers. Butchers' row near Subhansha is the oldest mutton market in the city. Here the butchers have their private stalls or sell in the front rooms of their dwellings. They have a common slaughter-house. The Bhavani ward mutton market, is a private building fronting the main road leading to the cantonment bazar which is temporarily licensed by the Municipality for the sale of meat. The municipal mutton markets are built on a standard plan with detached slaughter-houses. The stalls are arranged facing each other in a covered building on two feet high plinths with a central passage under the ridge. The side walls, which form the backs of the stalls, are carried to within two feet of the post plate and eaves of the roof. Each stall is six feet wide and seven feet long. It opens on the central passage and is separated from the next stalls by the posts which bear the roof. The whole of the inside stalls, as well as the passage, are paved and are washed daily. The slaughter-houses are paved and walled enclosures with an open entrance in one corner covered by a screen wall. Inside the pavement slopes to a gutter which drains into a cesspool outside, the contents of which are removed daily. The private markets are ordinary sheds or *chals* with earthen floors and detached slaughter-yards. The number of animals daily slaughtered varies from sixty to 180 and averages 120, three-fourths of them sheep and one-fourth goats. The slaughtered animals are hung up to poles in the slaughter-houses, skinned, and dressed, and the mutton is carried to the market and hung by ropes from hooks in front of the stalls. The butcher sits on a piece of sacking or mat on the floor of the stall with the meat hanging in front of him and a block of wood resting against his legs. The customers stand outside or below the stall where they are served. Mutton sells at $2\frac{1}{4}d.$ to $3d.$ ($1\frac{1}{2}$ - 2 *as.*) a pound. A butcher kills daily one to three sheep or goats according to demand. Buyers generally keep to one butcher and those that use meat daily settle accounts once a month. The butchers are Marathas and Muhammadans. Most animals are slaughtered by Musalman priests or *mullas* who are paid $\frac{3}{8}d.$ to $\frac{3}{4}d.$ ($\frac{1}{4}$ - $\frac{1}{2}$ *a.*) an animal. Musalmans kill animals the killer facing west with the animal's head to the south and the legs to the north. Jews, Bohoras, and some Marathas have peculiarities in the way of slaughtering animals and have compartments allotted to them at the slaughter-houses. The Bohoras do not kill the animals on the stone pavement but on wooden platforms. Some Marathas first offer the animal to the goddess Bohai and after killing it offer its head to the goddess. Jews have a special butcher and have compartments allotted to them at the different slaughter-houses.

Fish.

The three fish markets are to the south of the Shanvar palace and in Aditvar and Vetar wards. In open ground to the south of the Shanvar palace forty or fifty stalls are kept daily by Bhoi women for the sale of dry Konkan fish. A well-built private fish market with twenty-four stalls arranged in rows in Aditvar ward back street is used chiefly for the sale of salt fish, with a few fresh fish in the evening. A third fish market is held in Vetar ward where fresh fish and a little dry fish are offered in an open plot. Women of the Bhoi caste are the chief fish-sellers and Kunbis from the neighbouring villages are the chief consumers.

Fuel.

The chief fuel of the upper and middle classes is firewood which is brought in carts and sold at 8s. to 10s. (Rs.4-5) the cart-load. Cowdung-cakes are the main fuel of the bulk of the townspeople. A cart-load of about 500 cakes costs 4s. to 6s. (Rs. 2 - 3). Retail sales of firewood and cowdung-cakes are made at the Mandai under the west wall of Shanvar palace and in many private enclosures. The only market where a month's supply or other large quantity can be bought is the Gadetal or Cart Stand in the north-east of Mangalvar ward. This *tal* or stand is an open field, let only during the fair season, where about 175 cart-loads of cowdung-fuel and 250 cart-loads of firewood are daily brought and sold. Two large fodder markets are open only during the fair season, the Cart Stand or Gadetal which is also used as a fuel market and the sandy bed of the Mutha under the Lakdi bridge to the north-west of the city. *Kadba*, that is Indian millet or *jvari* stalks, is the chief fodder used in the city. About 200 cart-loads, containing 100 to 200 bundles and selling at 8s. to 12s. (Rs. 4 - 6), are brought daily to the Gadetal and sixty cart-loads to the Lakdi bridge market. Besides in these two chief markets millet stalk and fodder can be bought retail in the Mandai and in several other places in different parts of the city. Hay or grass is stacked in large quantities beyond the Lakdi bridge and in the out lying yards on the west of the Sadashiv ward. Hay is rarely used in the city. Most of the dry grass goes to the military cantonment where large quantities are used as horse-fodder. Fuel and fodder are brought to the city markets by villagers in their own carts and sold either to wholesale dealers or to consumers.

Grain.

The city has nine grain markets: Adte or Commission Agents' row in Nana ward, Dane or Grain row in Narayan ward, Dane row in Shukravar ward, Dane row in Budhvar ward, Dane row in Vetar ward, a rice market in Shukravar ward, pulse rows or Dalalis in Mangalvar Bhavani and Ganj wards, and a Maide or flour row in Aditvar ward. The chief food grains used in Poona are *bajri*, *jvari*, rice, and wheat, and of pulse *tur* and gram. Besides supplies from the villages round, *bajri* is brought from Vambhori a market town in Ahmadnagar, *jvari* from Sholapur, rice from West Poona and Thana and wheat and gram from the Upper Hills or Baleghat to the north-east of Sholapur. In special seasons grain comes from much greater distances. During the 1876-77 famine quantities of grain poured in from Central and Northern India and from Gujarat. In ordinary years the grain merchants of Poona import only for local use; during the 1876-77 famine Poona became the chief grain centre for the Bombay Deccan. The chief market for wholesale grain dealings is the Adte Ali or Agents' row in Nana ward. About forty of these dealers, chiefly Marwar and Gujarat Vanis, have large houses with front and rear enclosures and grain stores in neighbouring streets. Imports by country carts are brought to market in the morning and sales are negotiated at once. Imports by rail are brought at noon and in the afternoon and are sold off next morning. Grain is generally bought and kept in stock in 200 pound ($2\frac{1}{2}$ *mans*) bags which are opened only when the grain has to be measured out. During the fair season large heaps of grain-bags lie in front of the shops or in the open enclosures. The grain-dealers either buy on their own account or act as agents for the purchase or sale of supplies for others in distant districts charging a three to five per cent commission. Residents in Poona who can afford it, buy their year's supply of grain at once. *Bajri* and *jvari* are bought in January and February, rice in November and

December, and wheat and pulse in March and April. Except some retail grain-dealers of Narayan ward all retailers in the city buy in the wholesale market of the Nana ward. They either buy a year's stock at the proper season or, as they sell off their stock according to the means at their command. The wholesale dealers are men of capital, the retail dealers borrow money and trade on the security of their stocks. The Narayan ward dealers are Marwar Vanis of small capital, and as many of them have money dealings with the landholders of West Poona, they buy direct from the villagers. Narayan ward has about thirty retail grain shops, and in the grain row in Shukravar ward, which is the leading retail grain market in the city, are about 105 grain shops. Vetar ward has fifteen shops and Apa Balvant street in Budhvar ward has forty. In the wholesale markets grain is measured and sold as it comes. In the retail markets it is dried in the sun, winnowed in the breeze, cleaned, and laid out, if the quantities be large in bags, and if small in baskets, in the shops, at the street sides, or on the shop boards. All retail grain-dealers are Marathas. They keep their shops open all day, but most business is done in the evening. They earn 2S. to 6s. (Rs. 1-3) a day. The Mavlis or West Poona landholders bring their rice to market in head-loads or on ponies generally in November and December and only on Mondays or Thursdays. They go to the grain row in Shukravar ward, where each retail-grain dealer has his own west highland villagers who go only to his shop. The dealers either sell on commission on account of the growers who bring their produce to market, or they buy wholesale from the growers on their own account and sell afterwards.

Pulse Splitting.

In Poona the making of gram, *tur*, and other pod-seeds into pulse is a distinct calling carried on by Pardeshi or North Indian and Maratha *dalvalas* or pulse-splitters. The beans are soaked in water in large earthen pots for an hour or two, and laid in the sun to dry, which helps to separate the husk from the seed. When the beans are dry they are lightly ground in large stone handmills, the upper piece of which is balanced on a pivot and lowered or raised at will so as to keep the two pieces far enough apart to split without crushing the beans. After being split the beans are winnowed and sifted and the split pulse is ready for sale. The husk or *phol* and the refuse or *chun* are sold as food for milch-cattle. Pulse-makers work and sell in three parts of the city: in thirteen shops in pulse row or Dal Ali in Mangalvar ward, in forty-five shops in Dal Ali in Bhavani ward, and in sixty shops in Dal Ali in Ganj ward. During the hot season, when only they work, the pulse-dealers make 2s. to 4s. (Rs. 1 - 2) a day. All are well-to-do.

Flour Grinding,

A part of east Aditvar street is held by Maratha flour-grinders or *maidevalas*. In making flour, as in splitting pulse, the grain is soaked in water and dried in the sun, and is then ground as fine as possible. The flour is afterwards sifted through a sieve, the fine flour being separated from the coarse flour or *rava*. The coarse flour, which is valued the most, sells at $1\frac{1}{4}d.$ ($\frac{5}{6}$.) a pound, while the fine flour sells at $1d.$ ($\frac{2}{3}a.$) the pound. The refuse is not used for human food. Both the first and the second flours form the chief part of all festive Hindu dainties. Flour-grinders, of whom there are nine grinding-houses and

twelve shops in Maide or Flour row, make about 4s. (Rs. 2) a day in the busy marriage season and 2s. (Rs. 1) a day at other times,

Grocery.

Retail grocers' shops are scattered all over the city. Almost every street has one or more. The chief centres of the grocery trade are four: in Bhavani ward, in Adte or Agents' row in Aditvar, in Moti Chauk or Pearl Square, and in the main street of Vetral ward. The Adtes or commission agents of Bhavani ward are Lingayat and Dakshani Vanis who receive consignments from Bombay and up-country merchants and sell them locally or send them to Bombay or other large markets. In no case do these agents keep goods in Poona more than a few days and they do business only on commission. The chief articles which pass through their hands are *gul* or raw sugar, oil, tobacco, *ghi* or clarified butter, and refined sugar. Their business is brisk both just before and just after the rains. During the rainy season, from June to October, they are almost idle. The grocers of the Aditvar and Vetral wards deal in all kinds of grocery, importing from Bombay and up-country trade centres but selling only in Poona. They have retail shops as well as large warehouses at which they do wholesale business. All are Gujarat Vanis chiefly Vaishnavs and are men of capital. Their yearly dealings average £10,000 to £15,000 (Rs. 1 - 1½ lakhs) and their yearly profits £200 to £500 (Rs. 2000-5000). Retail grocers, most of whom are Gujarat Vanis and a few are Brahmans, have capitals of £50 to £500 (Rs. 500 - 5000), most of it their own, and make £2 to £5 (Rs. 20 - 50) a month. A grocer sits on a box or on a raised mud platform, keeps his articles arranged round him in baskets or bags, those most in demand within arm's length, oil in a leather jar, and costly articles and rarities hung overhead in bags with labels. Dry goods are served in waste paper or green leaves, and liquids in pots and bottles which the customer brings with him. Grocers look greasy and dirty and are slovenly in their business.

Metals.

An account of the Poona metal work, which is one of the chief industries of the city, is given in the Craft chapter. [See Part II pp. 174-185.] Poona has three leading metal marts in the main street of Aditvar ward south of the Pearl Square or Moti Chauk, further south near Subhansha's house, and in the main street of Vetral ward. The dealers are Kasars who do all the local business. The export of brass and copper vessels is carried on by Marwar and Gujarat Vanis, who are more pushing than the Kasars. The Pearl Square Kasars sell ready-made cooking and water pots. The Marwaris near Subhansha's tomb confine themselves mostly to the making of bells, small cups, *lotas*, saucers, and other castings, while the Gujaratis in Vetral Peth chiefly make large vessels. The vessels are arranged in tiers in the shops, the smaller articles being hung from the roof in bundles. Two branch streets, both called Taveali or Ironpan row, are given entirely to the making and sale of iron pots and pans of English sheet iron. The pots are made and sold in the same place, the shops and workhouses being in the same building. The business is in the hands of poor Marathas who borrow capital at twelve to twenty-four per cent a year, and, though they make a fair profit, generally spend all their earnings. Copper brass and iron sheeting is brought into Poona in large quantities. It is worked into all the forms and sizes of pots

required by Hindus and other classes for house use. The vessels are sent to the Nizam's dominions, the Berars, and the Bombay Karnatak. The export trade and the bulk of the profits are almost exclusively in the hands of the Marwar and Gujarat Vanis, the Kasar and Maratha workmen not making more than a comfortable living out of their calling. Metal sheets are sold only in the main street of the Vetar ward.

Cloth.

Poona City has three cloth markets: the Kapadganj or Cloth Store in the Aditvar ward, the Bohori-ali also in Aditvar ward, and the Kapadali and Cholkhan-ali or Bodice-row in Budhvar ward. The dealers in the Aditvar ward Kapadganj are all Marwaris. Those in Bohori-ali are chiefly Bohoras, with a few Marathas and Brahmans. The cloth-sellers in Budhvar ward are chiefly Shimpis. The Marwaris of the Aditvar Kapadganj are the largest traders. They do business both wholesale and retail and almost exclusively in hand-made cloth. The chief marts from which cloth is brought are Nagpur Ahmadabad and Dharwar for the finer cotton-goods, Yeola and the local looms for silks and embroidered cloth, and Sholapur for the rougher waist-cloths and robes used by the poorer classes. The Shimpis of Budhvar ward also deal in the poorer kinds of hand-woven cloth. They supply the middle and low class demand, and the Marwar Vanis supply the rich. The Bohonis and other dealers of the Bohori-ali sell all kinds of European piece-goods as well as the produce of the Bombay mills. *Kinkhabs* or embroidered silks and coloured China and European silks are also sold by the Bohoras. The Shimpis of Cholkhan-ali or Bodice-row sell nothing but the variegated cloth of which Hindu women make their bodiees. There is more variety in the colour, making, striping, and bordering of bodicecloth than of any other cloth. A cloth-merchant's shop generally consists of an outer or shop room and an inner room used as a godown or store. The shop is scrupulously clean, and cushions are spread round the foot of the walls for customers to sit on and lean against. The goods are kept in shelves along the walls. The shop fronts are shaded by red curtains which keep off the glare and dust and by causing a mellow ruddy light show articles, especially coloured goods, to advantage. All the leading cloth merchants of Poona are men of capital and do a large business. Minor dealers work with borrowed capital. The profits vary greatly according to individual dealings perhaps from £1 to £40 (Rs. 10 - 400) a month.

Jewelry.

Small silver and gold articles of personal decoration are sold in Moti Chauk or Pearl Square street in Aditvar ward by Sonars, Gujarat Vanis, and a few Brahmans. Old ornaments are also bought, re-made, cleaned, and sold. The more expensive jewelry, pearls diamonds and other precious stones, are sold by jewellers who have no regular shops but whose houses are well known. They generally sell at their own houses, but when required carry articles to their customers. Moti Chauk has about fifty shops, in which necklets anklets bracelets, and ear and nose rings are shown on stools, and the richer ornaments in glass cases. The shopkeepers squat on cushions and their shops are always neat. Trade is brisk during the marriage season. They are not men of capital, but their business yields them a comfortable living.

Timber.

At two markets in Poona City building timber is sold. One is in the west end of Sadashiv ward, the other is in Pangul row in Ganesh ward, the main and east streets on the borders of the Nagjhari stream. Timber is sold in logs as brought from the forest. Except heavy logs which are laid flat on the ground, the timber for sale is set on end in lines in large enclosures leaning against walls or on poles stretched on supports. Teak is the chief timber. As no local teak of any size is available, Maulmain or Malabar teak is brought by rail from Bombay. The Maratha timber-dealers of Sadashiv ward deal only in local teak and old timber. The timber-dealers of Ganesh ward are Konkan Musalmans who deal both in imported and in local teak. Timber is generally sold by the piece or log, the cubic measurement being taken only in dealings with Government. About forty-seven timber-dealers make £50 to £200 (Its. 500 -2000) a year.

Snuff and Tobacco.

Poona has the largest snuff and tobacco market in the Deccan. About seventy-five tons (2108 Bengal *mans*) of tobacco are brought every year from the Kanarese and Deccan districts. It is cured, cat,; dressed, and spiced for chewing or ground into snuff. The Tambakhu row in Shukravar ward and the two Tapkir rows in Budhvar and Shanvar are entirely given to the caring of tobacco. Large quantities of tobacco are used in Poona, the better classes who do not smoke chewing tobacco. Poona-made snuff is sent in large quantities to all parts of India. A tobacco or snuff shop differs little from a grocer's shop except that the curing and dressing of the tobacco or the pounding, into snuff is carried on in the shop itself. The leading tobacco dealers are Lingayat Vanis and Brahmans, the Brahmans confining themselves chiefly to snuff-making. The Lingayats do more business than the Brahmans and earn £40 to £80 (Its. 400 - 800) a year. The Brahman snuff-makers make £20 to £40 (Its. 200 - 400). All classes take snuff, especially Brahmans and elderly women of other castes.

Stationery.

Poona has two markets for the sale of stationery, one in Budhvar main street and the other in the Bohori-ali of Aditvar main street. These shops sell a mixture of stationery, peddlery, and haberdashery. The business was formerly wholly in the hands of Bohoras, but of late a number of Brahmans have opened stationery and haberdashery shope as being easy to manage and requiring little training. Stationers show their wares in cases, cupboards, or shelves, or hang them from the shop-roof. They make £1 10s. to £5 (Its. 15 - 50) a month.

Spice Sellers.

In the main street of Budhvar ward are the shops of Gandhis who sell scented oil, incense, perfumes, and preserved fruit. The oils are kept in leather jars and sold in small Indian-made glass phials shaped like wine decanters. Dry perfumes are served wrapped in paper, and peaches and other preserved fruit are kept in lacquered earthen jars Gandhis

make high profits in proportion to their capital, but their business is small and is confined almost entirely to festive times. About twenty-six Gandhis make £2 10s. to £7 10s. (Rs. 25 - 75) a month.

Flower Sellers.

The Flower Sellers, for which Poona is famous, have two regular markets. In an open veranda with a boarded floor the Phul-malis, generally the men, sit with baskets of flowers, according to the season, around them and a wet cloth spread in front of them. With a needle and thread they keep stringing garlands, nosegays, and bouquets, and attend to customers as they call. In the gardens round the city plots of flowering plants are regularly grown and let to Malis for the season's flowers. The Mali's wife and children pluck the flowers in the evening before they are fully open and carry them home in baskets covered with green leaves, generally plantain leaves as plantain leaves keep flowers cooler than other leaves. Next morning the Mali carries the baskets to his shop, strings them into garlands and wreaths, and sells them to customers. The flower-man is always busy at festive times. Of the two flower markets, one is in Budhvar ward opposite the site of the late Budhvar palace, the other is in Vetar ward which is known as Flower Square or *Ful-chauk*. About twenty-three Malis have flower shops in the two markets and earn £1 to £1 10s. (Rs. 10-15) a month.

Animals.

The Poona Cattle Market is held in open ground at Bhamburda village close to the west of the city. It is held on Wednesday and Sunday afternoons. The animals sold are bullocks, buffaloes, cows, ponies, sheep, and goats. About 100 bullocks, 40 buffaloes, 25 ponies, and 90 goats are brought to market on each market day. Bargains are made through *dalals* or brokers.

Management.

The details regarding the management of the city come under four heads civil, criminal, police, and municipal. The civil work is managed by three sub-judges, a Small Cause Court, and an arbitration court. The criminal work is managed by two stipendiary magistrates, one of the first and one of the second class, and three honorary magistrates, one of the first class and two of the third class, who hold their courts twice a week. The city police consists of one inspector, three chief constables, forty-two head constables, two mounted police and 198 constables. [Details are given above under Justice pp. 1-40.]

Municipality.

The Municipality was established in 1856-57 and the management of its affairs entrusted to a committee of thirty members, nine of whom were ex-officio Government officials and twenty-one non-official nominated members. In 1874 the number of the committee was raised to thirty-six of whom nine were ex-officio Government officials and twenty-seven were nominated members. In April 1883 the number was fixed at twenty-eight

members, twelve elected, seven nominated, and nine ex-officio Government officials to be ultimately reduced to five, when the committee will consist of twenty-four members. The executive administration is entrusted to a managing committee of seven elected members. The managing body elect one of their members as chairman who holds office for one year. The general body holds four quarterly meetings and the managing committee meets once a week. The municipality has an executive salaried staff of four, a secretary, an engineer with fourteen subordinates, a health officer with nine subordinates, and a superintendent of octroi with seventy subordinates. The monthly establishment charges amount to about £226 (Rs. 2260). The following table shows the municipal income, its sources, and incidence from 1858

Poona City Municipal Revenue, 1858-1883.

1882-83	4574	16	0	11	23,304	0	4	$8\frac{1}{8}$	

The 1858-59 income began with £2800 (Rs. 28,000) chiefly from tolls. In 1860-61 it rose to £4505 (Rs. 45,050) chiefly from a Government contribution of £1242 (Rs. 12,420). In 1860-67 a house-tax yielding £2504 (Rs. 25,040) was imposed and the income rose to £6606 (Rs. 66,060). In 1869-70 octroi took the place of tolls and the income rose to £12,983 (Rs. 1,29,830). In 1875-76 a water-rate was imposed and the farming system, which had brought down octroi from £10,801 to £7810 (Rs. 1,08,010-Rs.78,100) in 1874-75 was abolished. The water-rate was imposed to meet a new liability of £1000 (Rs. 10,000) which the municipality incurred by entering into a contract with Government for water from the Mutha canal which had just been opened. In 1876 the proceeds of a wheel-tax and the departmental collection of octroi brought up the income to £14,814 (Rs. 1,48,140). In 1878-79 a privy cess was imposed and a poudrette manufacture started in 1879-80. From £16,961 (Rs. 1,69,610) in 1879-80 the income rose to £23,304 (Rs. 2,33,040) in 1882-83 the chief increase being from octroi and poudrette, the income from poudrette alone being £4574 (Rs. 45,740) as the demand for manure rose greatly with the increase in wet cultivation due to the opening of the Mutha canal. Since 1882-83 the price of molasses has fallen, sugar cultivation has decreased, and with it the demand for poudrette.

The municipality maintains four fire engines, contributes yearly £500 (Rs. 5000) towards the cost of the city police and lights the city roads at a yearly cost of £1000 (Rs. 10,000). Tie city conservancy is done by manual labour. The streets are daily swept by women sweepers and the garbage and house refuse are gathered in 300 dust-bins placed at convenient distances along the streets. From the bins the sweepings are partly sold to potters and partly carted to a store half a mile to the south of the city, where they are piled in heaps and burnt to ashes. The potters remove the rubbish to their kilns on their own

donkeys and pay the municipality £500 to £000 (Rs. 5000 - 6000) a year. The ashes prepared at the store are carted to the poudrette works. The municipality maintains 150 road sweepers and twenty-five dry rubbish carts for road sweepings and garbage which they cart at a cost of £140 (Rs. 1400). At a yearly cost of £3500 (Rs. 35,000) the municipality employs 280 scavengers to collect nightsoil from 7800 private privies and fifty-four public latrines with 286 seats, and twenty-eight iron barrel carts to remove the nightsoil to the poudrette works. The nightsoil and ashes are mixed in open beds at the works and exposed to the sun to be dried. The deposit is daily raked up and a little fresh ashes are added at each raking. When dry, the mixture becomes inoffensive to smell or sight. The proceeds of the poudrette, of which about 6000 tons are yearly turned out, amount to £360p (Rs. 36,000) against a total conservancy charge of £5000 (Rs. 50,000).

The municipality has moved thirty-six potters' kilns and twenty-eight tanneries outside municipal limits, and has placed under control dyers butchers and others who practise the less offensive trades and has confined them to particular places. Six slaughter-houses and meat markets have been built in convenient places; three burial grounds are provided on three sides outside municipal limits, and two burning grounds have been built on the Mutha bank one for Brahmans near the Omkareshvar temple, and the other for Marathas and others near the Lakdi Pul to the south-west of the city. The old burning ground was near the meeting of the Mula-Mutha. Within the city are seventy-two partly used burial grounds. Most of them are used by Muhammadans, five or six by low caste Hindus, and two by Christians. It is hoped that these burial grounds may be closed by degrees. The registration of births and deaths has been made compulsory, and the registers showed a death-rate in 1882-83 of twenty-four to the thousand. About 3000 children are yearly vaccinated by two municipal vaccinators.

Drainage.

Two-thirds of the city, including the nine wards to the west of the Nagjhari stream, have under-ground sewers into which house and privy drains carry the sullage and liquid discharges. The sewers empty into an intercepting drain 2½ feet broad and 4½ feet deep arched over on the top. The intercepting drain called the Gandha Nala is carried along the river bank from one end to the other of the city where it discharges into the river. One sewer discharges into the Nagjhari stream itself. The sewers are faulty in shape and material and do not work well. They are either mere rectangular cuts or channels in the ground varying from six to eighteen inches in size, lined with stone without cement, and covered with loose slabs or irregular blocks of stone. The sewers have often to be opened and cleared of the solid deposit which continually gathers in them and oozes into the adjacent ground. The eastern third of the city has no sewers. A new drainage scheme designed on the latest scientific principles is now under the consideration of the municipality.

Where there are no sewers, the sullage is gathered outside each house in a pit, and removed to gardens outside municipal limits. The sewers were built with the aqueducts about 1782 by Madhavrav the seventh Peshwa (1774 -1795).

The natural drainage of the city is good and the surface of the streets and gullies is completely washed every rainy season. This yearly washing adds greatly to the cleanness and healthiness of the city. The city has a fall from south to north of about seventy feet, being fifty feet a mile. The westmost part slopes west into the Ambil Odha stream which runs south-east to north-west along the western limits of the city. In the heart of the city the Nagjhari stream, which rises in the hills 1 ½ miles to the south of the city, runs through it from south to north, and drains both banks for half a mile on either side. The eastern half mile of the city drains into the Manik stream which runs south to north and forms the eastern boundary of the city.

Roads.

The city has thirty-eight miles of made roads fifteen to forty feet wide, and sixteen miles of lanes and alleys varying from six to fifteen feet wide. The roads are metalled, the chief roads yearly, and the others as they wear out every second third or fourth year. The yearly cost of maintenance is £2000 (Rs. 20,000). The chief alleys are gravelled every year, and the minor lanes every second year at a yearly cost of £200 (Rs. 2000). The chief streets are watered from the beginning of February to the end of June at a yearly cost of £300 (Rs. 3000). All the streets and lanes are lighted on dark nights at a cost of £1000 (Rs. 10,000) with 660 kerosine lamps placed about 120 yards apart.

Water Supply.

The city has an abundant water-supply. It has 1290 wells, but except some in gardens and in the outskirts of the city, though used more or less for washing and bathing, all are brackish and unfit for drinking. The Mutha, which skirts the city for two miles on its north and west boundaries, is also largely used for washing and bathing and affords almost the only water for cattle. Since the opening of the Mutha canal along the high ground to the south of the city the Nagjhari stream which crosses the city, and the Manik stream which forms its eastern boundary, hold water throughout the year and are largely used for washing and bathing. Where within reach the runnels from the canal are also used for washing and bathing.

The drinking water comes from four private aqueducts and from the Mutha canal. It is now pretty evenly distributed over the city though parts of Shukravar, Vetal, Ganj, Ghorpade, Bhavani, Nana, Rastia Nyahal, Somvar, and Mangalvar wards have a scantier supply than the low-lying southern and northern wards. The water is delivered in to dipping wells, and, where abundant, is used for bathing and washing. The city has eighty-four dipping wells and seventy-five stand-pipes and 1150 houses have water laid on to them. The four private aqueducts are the Katraj with a daily supply of 650,000 gallons, the Chaudhari aqueduct of 50,000 gallons, the Nana Fadnavis aqueduct of 100,000 gallons, and the Rastia aqueduct of 50,000 gallons. The Mutha canal gives a supply of 650,000 gallons, making a total daily supply of 1,500,000 gallons that is a daily average of fifteen gallons a head.

Aqueducts.

The Katraj aqueduct was built about 1750 by the third Peshwa Balaji Bajirav (1740-1761). The source of the aqueduct is in two ponds impounded by masonry dams in the Katraj valley four miles south of the city. The two ponds, which lie one below the other, the upper feeding the lower, are fed by the drainage of the valley through sluices. The water of the first floods is carried off by diverting channels cut along the pond sides and only the water of the latter rains is taken. The supply of the ponds does not wholly depend on the impounded water, as much of it comes from springs in the pond beds. The springs are caught in a masonry duct at the bottom of the lower pond and let into the channel of the aqueduct. The water of the ponds passes into the aqueduct by six-inch openings in the dam, the openings being two feet apart along the dam face. The aqueduct is an arched masonry work about 2' 6" wide, six feet high, and over four miles long. It is large enough for men to walk through and work in when removing silt or making repairs. The line of the duct is intercepted at about every 100 yards by seventy wells sunk four to ten feet below the level of the bottom of the duct, and raised a few feet above the surface of the ground. The wells act as air shafts and settling ponds where the silt is laid and the pure water allowed to pass into the duct. In every fourth or fifth well, the outlet of the duct is blocked with masonry, the discharge of the water being regulated through holes three to six inches in diameter. The aqueduct has a greatest discharge of a water volume of a sectional area of about 144 square inches, and ordinarily of six to 7½ square inches or three gallons a second. As a break of head occurs at each intercepting well the flow of water is small. As much of the channel is cut to a considerable depth below the ground, it taps numerous small springs along its course, and in three or four places has water let into it from independent wells by its side. As a feeder to the Katraj aqueduct and a place of recreation and ornament, Balaji Bajirav the third Peshwa (1740-1761) built in 1755 the Parvati lake at the south-west corner of the city, by scooping out and enlarging the Ambil Odha stream and clearing for the lake a space measuring 550 yards by 225 containing twenty-five acres. [Details are given below under Parvati Lake (91).] The Ambil Odha stream has been dammed and diverted, and sluices provided in the dam to fill the lake from the floods of the stream. Three smaller lakes are formed in the old channel, where the lotus plant is largely grown for its flowers. The surplus discharge from, the Katraj aqueduct finds an outlet into the Parvati lake which also serves as a feeder to the aqueduct when the Katraj lake or aqueduct is under repair.

The Nana Fadnavis aqueduct was built about the year 1790 by Nana Fadnavis. It is a small work and supplies only two dipping wells and the Vishrambag palace(40). The aqueduct is brought from a well in Narhe Ambegaon village six miles south of the city, and is built in the same style as the Katraj aqueduct, but smaller, consisting of nine-inch tiles embedded in masonry. The Rastia and Chaudhari aqueducts are built like the Nana "Fadnavis aqueduct. Both rise from springs in Kondva village seven miles south-west of the city, and are led to public dipping wells near the Rastia and Chaudhari mansions. The date of both is somewhat later than that of Nana's duct. The municipality maintains only the Katraj aqueduct. The three other ducts are maintained by the descendants of Nana, Rastia, and Chaudhari.

Mutha Canal Supply.

The [Contributed by Mr. W. Clerke, M.Inst. C.E.] Mutha canal supplies both the city and the cantonment of Poona with drinking water. There are two distinct systems of supply, one for the city the other for the cantonment. The supply for the city is taken off one mile to the east of Parvati hill, strained through filter beds of sand and charcoal and distributed in iron pipes throughout the city.

The chief part of the cantonment supply of drinking water is drawn from the canal about 200 yards east of St. Mary's church (109). The water-supply arrangements include four parts: (1) a water wheel which furnishes the motive power; (2) a system of pumps by which the water from the canal is pumped into the settling ponds and the filtered water is pumped about 770 yards south into the middle, and about 450 yards further south into the upper service, reservoirs; (3) settling ponds and filter beds with distributing mains; and (4) middle and upper service reservoirs with distributing mains. The water wheel, of about fifty horse-power, is of the form known as Poncelet's undershot wheel. It is sixteen feet in diameter and thirteen feet broad. It stands in the bed of the canal which at this point is given a drop of 2.75 feet to-obtain the necessary head of water. The pumps, which consist of a set of three centrifugal pumps and a pair of three throw force pumps are placed in a corrugated iron shed on the left hand of the canal; the power is passed from the wheel to the pumps by a system of spur and bevelled gearing and belting. The centrifugal pumps send the water from the canal into the settling ponds and the filtered water from- the dispense cistern into the middle service reservoir. The force pumps are used for sending the filtered water about 1200 yards south into the upper service reservoir which is too high to be reached by the centrifugal pumps. In the shed with the pumps a horizontal steam engine of about twenty-five nominal horse-power is also fitted up which can be geared on to work the pumps if any accident happens to the water wheel or the canal. The settling pond and filter beds are about twenty yards from the canal on its right bank. They consist of two settling ponds built of rubble masonry each 100 feet long by eighty feet broad and eleven feet deep, into which the water from the canal is forced by the centrifugal pumps through main pipes laid across the canal. The filter beds, which are on the north or canal side of the settling ponds, are two rubble masonry cisterns each 100 feet long by seventy broad and seven deep to the top of the filtering material, a four feet thick bed of sand and charcoal. The water is led from the settling ponds by an arrangement of pipes and valves into each of the filter beds through a semicircular *haud* or cistern the lip of which is level with the top of the filter bed. The water passes through the sand and charcoal of the filter bed and is gathered in porous pipe drains and led into the dispense cistern (100' x 20') which lies between the two filter beds. From the dispense cistern the filtered water is drawn off by two mains, one of which conveys water for distribution to the lower part of the cantonment and the other carries the filtered water to the pumps by which it is pumped about 770 yards south to the middle and about 450 yards further south to the upper service reservoirs. The middle service reservoir at the Vanavdi Barracks (116), about 770 yards south of the filter beds, is built of rubble masonry in the form of a regular pentagon each side 100 feet long. Its flooring is of concrete and the depth of water is ten feet; in the centre is a masonry pillar from which wire ropes stretch to the sides, and over the wire ropes is laid a corrugated iron covering. From the reservoir the water is led by a nine-inch main pipe for distribution in the higher parts of the cantonment not commanded by the dispense cistern. The upper service

reservoir is about 450 yards further south near the Military Prison (85), and, except that its sides are only fifty feet long, it is in every respect like the middle service reservoir. From the upper service reservoir the water is led by a six-inch main for distribution in the Vanavdi Barracks and in a few parts of the cantonment which are too high to be commanded by the middle service reservoir. In addition to these arrangements water is drawn direct from the canal near the end of East Street into a settling pond (120'X 60'x 8') from which it is passed through a filter and drawn off by a twelve-inch main for distribution in the lower parts of the Sadar Bazar. The daily city consumption from both the canal and the aqueducts is during the cold weather (1884) about 500,000 gallons and in the hot weather about 600,000 gallons. The existing arrangements are capable of meeting a daily demand of about 1,000,000 gallons. The municipality pays £1000 (Rs. 10,000) a year to Government for the canal water, provided the daily quantity drawn does not exceed 750,000 gallons. Excess water is paid for at 4½ *d.* (3 *as.*) the thousand gallons.

Medical Institutions.

Poona [Compare above Chapter XII. pp. 66-67.] has six medical institutions where medical aid is given free of charge. Two of them the Civil Hospital (101) beyond municipal limits and the Lunatic Asylum are Government institutions; two are municipal dispensaries in the Shanvar and Nana wards; and two, the Khan Bahadur Pestanji Sorabji Charitable Dispensary and the Sassoon Infirm Asylum (30) are works of private charity. Of private practitioners according to the English system of medicine three medical licentiates have dispensaries and several, chiefly retired Government servants, give medical advice, the medicine being obtained from three dispensing shops, two in Budhvar and one in Aditvar ward. The city has many practitioners of native medicine six- of whom, one of them a Musalman, enjoy large practice. The Civil Hospital is in a building near the railway station called after the late Mr. David Sassoon who contributed largely towards its construction. It has a senior and a junior surgeon, a resident apothecary, a matron, and two assistant surgeons, lecturers to vernacular medical classes attached to the hospital and in charge of in-door patients. The daily average attendance at the hospital is 162 of whom ninety-four are in-door patients. The Civil Surgeon is also in charge of the Lunatic Asylum which is in a Government building within municipal limits, and has a resident hospital assistant. It has an average of sixty lunatics. The Khan Bahadur Pestanji Sorabji Charitable Dispensary, endowed by the gentleman whose name it bears, is maintained by Government and is in charge of an assistant surgeon. The daily attendance averages 115. The two municipal dispensaries in the Shanvar and Nana wards take no in-patients. The daily out-door attendance is 120 in the Shanvar ward and eighty in the Nana ward dispensary. The Sassoon Infirm Asylum (30), started by the late Mr. David Sassoon and managed by a committee, has sixty-five inmates. It is maintained from the interest of a fund of £5500 (Its. 55,000) mostly contributed by Mr. Sassoon and a yearly municipal contribution of £120 (Rs. 1200).

Educational Institutions.

Poona City has 116 educational institutions, twenty-four of them Government and ninety-four private. Of the twenty-four Government institutions four are colleges and twenty are

schools. Of the four colleges one is an Arts College with 140 pupils and a daily average attendance of 122; one is a Science College in three divisions with 138 pupils and a daily attendance of 118; and two are vernacular Training Colleges, one for boys with 127 pupils and a daily average attendance of 106, and the other for girls with forty-six pupils and a daily average attendance of thirty-one. Of the twenty schools one is a High School with 597 pupils and a daily average attendance of 588; one is the Bairamji medical school with sixty-two pupils and a daily average attendance of fifty-nine; one is a female practising school with sixty-nine pupils and a daily average attendance of fifty-three; one is a Marathi preparatory school with 277 pupils and a daily average attendance of 227; five are vernacular girl schools with 301 pupils and a daily average attendance of 215; two are Hindustani schools with fifty-three pupils and a daily average attendance of thirty-seven; one is a low caste primary school with thirty-three pupils and a daily average attendance of twenty-two; and eight are Marathi schools with 1522 pupils and a daily average attendance of 1366. Of the ninety-four private institutions, except one Arts college started in January 1885 all are schools, eighty-five of them Native and seven Missionary, of the eighty-five Native schools two are High schools, one the Native Institution with 197 pupils and a daily average attendance of 155 and the other the New English School with 1200 pupils and a daily average attendance of about 1000; one is a high school for native girls and ladies with about seventy pupils started in January 1885; one is 'a drawing or Arts' school with about ten pupils and a daily average attendance of seven; fifteen are registered primary schools with 1079 pupils and a daily average attendant of 882; and sixty-seven are purely private primary schools with 3990 pupils and a daily average attendance of 3500. Of the seven Mission schools five belong to the Free Church Mission and two to the Society for the Propagation of the Gospel. Of the Free Church Mission schools one is a high school with 170 pupils and a daily average attendance of 158; one a vernacular school for boys with 172 pupils and a daily average attendance of 106; two are vernacular girls schools with 137 pupils and a daily average attendance of seventy-six; and one is an orphanage anglovernacular school with ten pupils and a daily average attendance of five. Of the two S. P. G. Mission schools one is a vernacular school with thirty-eight pupils and a daily average attendance of twenty-eight, and one an industrial school with fourteen pupils and a daily average attendance of eight.[Details are given above in Chapter XI. pp. 55-61.]

Museum.

A museum was started in Poona by subscription about 1875 but was abandoned after a few years. The present museum has 1650 articles chiefly specimens of geology, chemistry, and Indian arts and manufactures. Exhibitions of local arts and manufactures are held every second year and the surplus proceeds in cash and articles are transferred to the museum. The municipality contributes £20 (Rs. 200) a year towards its maintenance.

Library.

The Native General Library, maintained by private subscriptions and donations, has about 100 subscribers whose monthly subscriptions amount to about £6 (Rs. 60). The library had 5700 works worth £2500 (Rs. 25,000), which were burnt in the Budhvar

Palace fire of 1879. Subscriptions have been raised and a fund formed for a new building to which the municipality has largely contributed. A book fund has been started to which also the Municipality has contributed £50 (Rs. 500). Attached to the library is a reading room. The city has two other small reading rooms.

Newspapers.

Nine newspapers are published in Poona, two of which are daily English, one Anglo-Vernacular half-weekly, and six weekly one English one Anglo-Vernacular and four Marathi.

Objects.

The city has, within municipal limits, forty objects chiefly palaces and mansions from a hundred to three hundred years old.

Ambarkhana (1).

[Contributed by Rav Saheb Narso Ramchandra Godbole.] The AMBARKHANA, literally the Elephant-carriage house, in Kasba ward, originally known as Lal Mahal or the Red Mansion, was built in 1636 to the south of Poona fort by Shahaji for the use of his wife Jijibai and her son Shivaji (1627-1680) then a boy of twelve. It was strongly built and had many under-ground rooms, some of which remain. Shivaji and his mother lived for several years in this mansion under the care of Shahaji's manager Dadaji Kondadev who had charge of Shivaji's education. The name Ambarkhana or Elephant-car House was given to the palace under the Peshwas when it was turned into a store-house for elephant cars or *ambaris*.

Amruteshvar's Temple (2)

AMRITESHVAR'S TEMPLE, close to the Mutha river in the Shanvar ward was built by Bhiubai wife of Abaji Baramatikar and sister of Bajirav Ballal the second Peshwa (1721-1740). The temple is a solid stone building raised twelve to twenty feet to keep it above the river floods. It is reached by a flight of steps on the east. The shrine has a *ling* and a bull outside. On one side, overlooking the river, is a hall which is used for meetings. The temple enjoys a monthly grant of £1 10s. (Rs. 15) from the Parvati temple revenue.

Anandodbhav Theatre (3)

The ANANDODBHAV or Gaiety Theatre, in Budhvar ward, was built in 1863-64 by a Sonar named Krishnashet son of Narayanshet. The site belonged to the mansion of the great Tambekar bankers. The last of the Tambekar family pulled down the house and sold the materials and the site. The site was bought by the present owner and the theatre was built at a cost of £950 (Its. 9500). It was the first theatre in Poona, and, being in a central position, is largely used. Public meetings are also occasionally held in it. The building, which has room for 800 people, is approached by a narrow path from the main Budhvar

road and has two other approaches from a side alley. The building is square with a sheet iron roof resting on a wooden frame work. It consists of a stage 792 square feet in area and a pit covering 928 square feet. The pit holds 150 chairs and has three tiers of galleries on its three sides each of which holds 200 seats.

Animal Home or Panjarpol (4)

The ANIMAL HOME or Panjarpol in Shanvar ward was founded in 1854 from subscriptions raised by the chief city merchants. The immediate cause of the founding of the home was a police order to catch stray bulls and kill stray dogs. The Gujarati inhabitants of the city formed a committee and took charge of all stray cattle and dogs, and since then the home has become a permanent institution. All animals, healthy, maimed, diseased or old, are received, though the rule is to attend only to the disabled and unserviceable. Except to the poor, admission fees are charged at the rate of £2 10s. (Rs. 25) on horses and 6s. (Rs. 3) on oxen cows and buffaloes. Birds are taken free of charge but any amount paid on their account is accepted. When necessary a Muhammadan farrier is called in to treat sick horses. The other animals are treated by the servants of the home. Healthy animals are given grass and the sick are fed on pulse and oilcake. Healthy animals are made to work for the home. After recovery animals are given free of charge to any one who asks for them and is able to keep them. The home has two meadows or *kurans* near the city, one for which a sum of £26 (Rs. 260) a year is paid, and the other which is mortgaged to the home for £250 (Rs. 2500) the home getting the grass as interest. The average expenses of cutting, carrying, and stacking the grass in each field amount to £20 (Rs. 200) a year. The produce of these two meadows suffices for the wants of the home. In 1879 the home had about 200 head of cattle and 100 birds. In May, when most of the cattle and two deer were away at the grazing grounds, the home had ten horses, one *nilgay*, a black buck, and an antelope in a stable about twenty peafowls in a square railed off at the end of the stable, three or four monkeys with running chains on a pole under a large tree, two foxes, a hare, two rabbits, and a number of pigeons, some fowls, and a turkey. Besides these the home had one or two cows, a few goats, some bullocks, and sheep. Since 1879 neither the number nor the class of animals has materially changed. The home is managed by a committee of six of whom in 1879 four were Hindus and two were Parsis. The staff includes a secretary on £5 (Rs. 50) a month, two clerks on £1 10s. (Rs. 15) and £1 (Rs. 10) a month, and five or six servants each on 12s. (Rs. 6) a month. Two messengers are kept to watch the fields, and during the rains two extra men are engaged. The home has a yearly revenue of about £150 (Rs. 1500) chiefly from cesses on groceries at $1\frac{1}{2}d.$ (1 *a.*) a bag, on jewelry sales at $\frac{1}{4}$ per cent, on bills of exchange at $\frac{5}{32}$ per cent, and on grain at $\frac{1}{64}$ per cent. The average yearly cost of the home is about £300 (Rs. 3000). Except in very good seasons the surplus expenditure of £150 (Rs. 1500) is partly met by a yearly contribution of £70 (Rs. 700) from the Bombay Animal Home and the rest by local yearly subscriptions amounting to £80 (Rs. 800). The home buildings consist of long lines of roofed stables along the walls of an open square yard. The stables are wide and railed off, and the office rooms are on either side immediately within the entrance gate. Servants and clerks live on the premises in small out-houses.

Aryabhushan Theatre (5)

The ARYABHUSHAN or Arya-ornament Theatre in Ganesh ward, was originally built as a rest-house on the borders of the old city near Dulya Maruti's temple. The theatre is close to and on the city side of the Nagjhari stream which forms its eastern boundary. A water cistern or dipping well was also built near the rest-house for wayfarers. The building was afterwards used by the Peshwas for their periodical dinners to large gatherings of learned Brahmans. On the overthrow of the last Peshwa the building became the property of the state and, between 1818 and 1820, Captain Robertson, the Collector of Poona, gave it as a residence to his accountant a Mr. Houston. Until very lately the building was occupied by Mr. Houston's widow, who, in 1874, sold it for £105 (Rs. 10,500) and a further sum of £700 (Rs. 7000) was spent in turning it into a theatre. The front of the building is in three compartments, one behind the other, with an upper floor. The halls fronting the road are now used for a school. The two inner compartments form the stage with dressing and retiring side-rooms. At the back was a courtyard with open ground floor halls on three sides. The courtyard has been covered with a high tiled roof and forms the pit, while two storeys have been added to the side halls and they have been turned into galleries. The building is a plain wood and brick structure with a ground area of about 11,700 square feet. It holds an audience of 1200 and is the largest and most substantial of the city theatres.

Bel-Bag Temple (6)

BEL-BAG, in Budhvar ward, is a temple of Vishnu built by Nana Fadnavis (1764-1800). It was begun in 1765 and finished in 1769 at a cost of over £2500 (Rs. 25,000). The site, originally a garden known as Manis Mala, was used by the Peshwas for stables. Nana Fadnavis obtained the site for his temple, and, in 1779, secured the grant to the temple of the four villages of Vagsai in Poona, Galegaon in Ahmadnagar, and Pasarni and Vanegaon in Satara. In addition to these four villages Nana Fadnavis assigned to the temple some lands of his own. The income from these endowments, amounting to £500 (Rs. 5000) a year, was attached by Bajirav the last Peshwa from 1804 to 1818, and the management was entrusted to one Devasthale. Mr. Elphinstone restored the property and management to Nana's widow Jivabai in 1818 and the temple is now managed by her descendants. The temple is a small vaulted cut stone building covering not more than 1156 square feet with a conical spire and a small wooden hall with a terraced roof. In front an open yard of about 2000 square feet is used for special gatherings, when the yard is covered with canvas. On the other side of the yard is Garud on a small raised platform under a vaulted canopy. On each side of the temple are two small shrines for Shiv and Ganpati. The open ground round the temple is laid out in garden plots for growing flowering shrubs and the basil or *tulsi* plant for the worship of the idol. Attached to the temples are houses for the priest and the manager. Nana Fadnavis, the founder of the temple, laid down strict and minute rules for its management, and every item of ordinary and extraordinary expenditure has been fixed. His directions have been followed with the greatest strictness.

Bhavani's Temple (7).

BHAVANI'S TEMPLE in Bhavani ward, was built about 1760 by public subscription at a cost of about £500 (Rs. 5000). The temple has the usual solid stone-built idol chamber or shrine with a portico and spire and a wooden hall or *sabhamandap*. Attached on one side is a rest-house. Except from offerings the temple has no income. A fair is held in the Navratra holidays in *Ashvin* or September-October. Low class Hindus revere Bhavani more than Brahmans do, and offer goats and sheep in fulfilment of vows.

Bohoras' Jamatkhana (8).

The BOHORAS' JAMATKHANA or Meeting House in Aditvar ward was built about 1730 by subscription at a cost of £1600 (Rs. 16,000). The buildings, which have since from time to time been enlarged and improved at a great cost, are large and fill four sides of a spacious quadrangle. The courtyard is entered by a massive door with a well carved wooden roof, and in the middle of the yard is a large cistern or *haud* with a central fountain. On the left is a large hall with plain square wooden pillars used for dinners on public feast days To the right is the mosque, a flat roofed hall, very closely hung with lamps and chandeliers. Above the mosque the building rises four storeys high, with steep stairs in the walls. This bunding is never- used except by the high priest or *mulla* of the Bohoras when he visits Poona. [He is generally the deputy of the Mulla Saheb or chief Pontiff whose head-quarters are in Surat. Of the Bohoras, who seem to be of part Gujarat Hindu and part Arabic origin and belong to the Ismaili sect of Shias, an account is given in the Population chapter, Part I.] On the roof two pavilions with tiled roofs command one of the best views of the city. The upper floors forming the residence of the *mulla* or high priest, overhang a thorough-fare, on the other side of which are public cisterns fed by the Katraj water-channel.

Budhvar Palace (9).

The BUDHVAR PALACE in Budhvar ward, which was burnt down on 13th May 1879, was a three-storeyed building (150'X 140') with one large and one small court or *chawk*. It was built for public offices by Bajirav the last Peshwa about 1813. The woodwork of the palace was very strong and the beams were broad enough for a man to sleep on with comfort. The large court was a handsome quadrangle surrounded by cloisters of carved wooden pillars. From 1818 the Government public offices were held in this palace, and since its destruction the municipality have laid out a small public garden on the site. Attached to the palace was a building of two *chauks* or quadrangles with one upper floor throughout and a second floor over a part called the *Faraskhana* where tents and horse and elephant gear were kept. It escaped the fire and is used as a police office and lock-up. Government have recently granted the palace site and the Faraskhana to the Deccan Education Society for their New English School and Fergusson College buildings, the foundation stone of which was laid on the 6th of March 1885 by His Excellency Sir James Fergusson, Bart. K.C.M.G., G.C.S.I., C.I.E.

City Jail (10).

The CITY JAIL in Shukravar ward was the head-quarters of Bajirav Peshwa's artillery and was in charge of the Panse family who held the hereditary command of the artillery. It was turned into a jail in 1818. The building was surrounded by a high fortified wall and a ditch which is now filled. Lines of cells, on the usual radiating plan, with a central watch-tower have been built and accommodation provided for the guard, the hospital, the office, and the jailer's residence, the last outside the entrance gate. Workshops and a garden are attached to the jail. The female prisoners have very recently been placed in an isolated ward. The water-supply of the jail is from the Katraj aqueduct. This jail will shortly be abolished and the prisoners transferred to the central jail at Yeravda.

Dulya Maruti's Temple (11).

DULYA or ROCKING MARUTI'S TEMPLE is in Ganesh ward near the Nagjhari stream on the eastern boundary of the old city. This Rocking Maruti is one of the guardians of Poona, who gets his name because he rocked or swayed with grief while the Marathas were being destroyed on the fatal field of Panipat (1761). [The chief approaches to all villages and towns have temples of Maruti to guard the town against evil.] The first temple of Dulya Maruti was built about 1680 by Naro Anant Natu who also built Someshvar's temple in Aditvar ward. The building was repaired and enlarged about 1780 by Rakhmabai Johari a Brahman lady. A second temple of Balaji facing Maruti's was added about this time by Makna a Badhai or cabinet maker. About 1830 at a cost of £150 (Rs. 1500) both the temples were renewed and joined together by subscription among the people of Ganesh ward. The temple has a monthly grant of 8s. (Rs. 4) from the Parvati temple revenues and additional contributions are yearly raised in the ward for its support. The temple is in three compartments, the two shrines joined by a central audience hall or *sabhamandap*. The shrines are about twenty feet square and are built of solid cut stone. Each has one entrance door and paved platforms all round for the circuit or *pradakshina*. The roofs are vaulted and surmounted with conical spires about thirty feet high. The hall, including a central nave and side aisles, is a wood and brick structure with a tiled roof (35'x 24') and galleries over the nave for women to hear readings from holy books and sermons and song recitals.

Ganpati's Temple (12).

GANPATI'S TEMPLE in Kasba ward is said to have been a rude stone enclosure, first built by cowherds who saw a large piece of rock shaped like Ganpati and daubed it with redlead. When, about 1636, Shahaji built a palace at Poona, his wife Jijibai built a small stone temple to Ganpati close to the east of the site of the Ambarkhana palace (1). The temple is a small dark room covered with a roof which shelters barely the image and the worshipper. The god gradually rose in public esteem, and came to be and still is locally regarded as one of the town guardians whose blessings should be asked on all religious and social ceremonies and celebrations. A hall or *sabhamandap*. was added to the temple by the *athghares* or first eight Brahman families of Poona. [The first eight Brahman families in Poona are Bharange, Dharmadhikari, Dhere, Kalange, Kanade, Nilange, Thakar, and Vaidya.] The hall is a dark chamber with a small entrance at one end. The walls and roof are like those of the first temple, built of solid stone plastered with cement.

The Lakde family added a pavement all round the temple and a long upper-storeyed open shed on one side as a rest-house or place for caste dinners and gatherings. Mr. Gajananrav Sadashiv Dikshit, a Deccan Sardar, added another hall in continuation of the old hall. The new hall is entirely open, rests on plain wooden pillars, and has a tiled roof. In 1877 a public cistern was built in the temple yard. The temple enjoys a monthly allowance of 10s. (Es. 5) from the Parvati temple revenues, and the expenses of the yearly celebration of Ganpati's festival on *Ganesh Chaturthi* the bright fourth of *Bhadrapad* in August-September are also paid from the Parvati grant.

Ghodepir (13).

GHODEPIR or the HORSE SAINT in Nana Peth is a life-size horse of sawdust and paste plastered over with fine clay. A Musalman bier or *tabut* is built every year on the back of the horse. The horse is worshipped by low class Hindus when in trouble, and babyless women and mothers with sick children come and vow offerings and penances. Nana Fadnavis had a Muhammadan attendant named Nathubhai. After Nana's death, to preserve his master's name Nathubhai made a small clay horse which still remains and raised a bier calling it Nana's bier in Nana's ward outside a house known as Vanavle's. The horse gradually rose in public favour, and subscriptions came in and a site for the Horse Saint's house was bought. Nathubhai after wards became a trooper in the Southern Maratha Horse and such was his regard for his old master that he spent all his yearly earnings on the yearly bier. On Nathubhai's death, the people of Nana ward, with one Padval as their manager, subscribed to maintain the horse his house and his yearly mind-feast. The offerings at the shrine grew so large that no subscriptions were needed, and Padval remained in charge. The present yearly income from offerings is £150 (Rs. 1500) and the shrine is managed by the descendants of Padval. Two small shops have been built facing the horse, whose rents go towards the maintenance of the shrine. The present shrine, which is called the *asurkhana* or spirits' house, a plain tiled structure (50' x 24' x 25') of wood and brick, was built about 1845.

Jama Mosque (14).

The JAMA MOSQUE in Aditvar ward, the chief Muhammadan place of worship in the city, was built about 1839 by public subscription at a cost of about £1500 (Rs. 15,000). Since then from time to time additions have been made. The mosque consists of a large stone hall (60' x 30') with a dome. The back wall has a niche with a step against it, and is covered with texts from the Kuran. In front of the mosque is a well sanded yard with a fountain in the middle. On one side is a washing cistern or *hand*. Attached to the mosque is a Persian school, a rest-house, and some dwellings whose rents go to the mosque fund. All Muhammadan social or religious meetings are held in this mosque.

Kotval Chavdi (15).

KOTVAL CHAVDI in Budhvar ward, in the middle of the main street which runs all round it, was the Peshwas police office. It is a one-storeyed house, the upper storey for offices and the ground floor for cells. The building was sold by auction for £110 (Rs.

1100) and is now made into stalls where a small market is held, and fruit, vegetables, grain, stationery, and groceries are sold. The building is now worth about £3000 (Rs. 30,000).

Moroba Dada's Vada (16).

MOROBA DADA'S MANSION in Budhvar ward was built by Moroba Dada Fadnavis, sometime prime minister of Savai Mdahavrav (1774-1795) the seventh Peshwa. It is a spacious mansion with six quadrangles or *chauks*. Opening on to the quadrangles or *chauks* instead of walls is ornamental wooden trellis work. Two of the quadrangles have water cisterns and until lately one was covered by a high wooden canopy. All the pillars are carved in the cypress or *suru* pattern, the intervening spaces being filled by cusped panel arches of thick wood. The mansion has throughout a wooden ceiling, and all the roofs are terraced. On the third floor is an ivory hall or *hasti-danti divankhana*, with ivory let into the ceiling and other parts of the room. The whole mansion is still in order and worth a visit.

Nageshvar's Temple (17).

NAGESHVAR'S TEMPLE in Somvar ward is believed to be the oldest temple in Poona, though neither its date nor its founder's name is known. Its style and the ornament on its tower seem to show that it belongs to Muhammadan times perhaps to about the end of the sixteenth century. The temple proper is a small close room of solid stone, with one door and a conical tower with embossed stone figures. The *ling*, which is said to be a natural rock, is about four feet below the outside level. Attached to the temple is the hall or *sabhamandap* open on three sides, a massive imposing building on wooden columns with a neatly finished wooden ceiling. A large space round the hall is enclosed and paved and rest-houses and a residence for the temple priest are built along the walls. The temple priest receives a monthly allowance of 11s.3d. (Rs. 5½) from the Parvati temple revenues. Large additions and changes, including a new smaller temple of Vishnu, were made about 1780 by one Aba Shelukar, and in 1878 by Mr. Raghupatrav Aurangabadkar who built public cisterns within and outside of the temple enclosure.

Narpatgir Temple (18).

The NARPATGIR TEMPLE in Somvar ward was built by Narpatgir Gosavi at a cost of £5000 (Rs. 50,000). The temple has a cistern and a fountain.

Narsoba's Temple (19).

NARSOBA'S TEMPLE in Karkolpura in Sadishiv ward, in the south-west corner of the city, was built about 1788 by one Ganu Joshi. The temple has a stone shrine with a spire and a wooden hall. On the doorway is a drum-house or *nagarkhana*. The object of worship is Narsinh or the man-lion the fourth form of Vishnu. The image has a lion's mouth and is shown tearing in pieces the demon Hiranya-Kashipu who lies in its lap. This form of Vishnu is seldom worshipped. The temple has a yearly income of about £40 (Rs.

400) chiefly from offerings. Vows of walking a number of times round, the shrine, usually a hundred thousand times, are made by women to get children or to get cured of evil spirits and bodily ailments.

New Market (20).

The NEW MARKET is a large central vegetable and fruit market now (August 1884) being built by the Poona Municipality in the heart of the city on a site of eight acres between the Tulsibag and Rameshvar temples in Shukravar ward. The main building is to be an octagonal tower in the middle, forty feet across, with radiating lines. The central tower is to have stalls on the ground and upper floors and its height to the pitch of the roof will be eighty feet. A clock tower 120 feet high is to be attached to the market. It is proposed to build ranges of stalls round the main building.

The site has been bought for £5000 (Rs. 50,000) and the cost of the main building is estimated at £15,000 (Rs. 1,50,000), while the extensions are estimated to cost about £20,000 (Rs. 2,00,000). The whole market when finished will have cost £40,000 (Rs. 4,00,000). It will be a handsome and substantial building. The roof is to be of machine made tiles, supported on teakwood frames and cast-iron columns. The main building will hold about 250 stalls, and the extensions about 350 more. Water is being laid on the building in iron pipes from the Khadakvasla canal.

Nivdungya Vithoba's Temple (21).

NIVDUNGYA VITHOBA'S TEMPLE in Nana ward was built by a Gosavi and rebuilt about 1830 by a Gujarati banker named Purshottam Ambadas at a cost of £3000 (Rs. 30,000). The image is called Nivdungya because it was found among prickly pear or *nivdung* bushes. The temple is very spacious and includes a cut-stone shrine with a spire and a wooden hall. Round the temple is a garden with a large public water cistern. Along the enclosure wall are cloister used for caste dinners. On the south side are some rooms fitted for dwellings and let to tenants. On the north is the residence of the priest. Over the gateway is a drum-house or *nagarkhana*. Outside the enclosure on the west is an open shed which is used as a rest-house by wandering beggars. On the south are ranges of shops and houses, the rent of which, amounting to about £50 (Rs. 500) a year, goes to the temple.

Nossa Senhora da Conceicao's Chuech (22).

NOSSA SENHORA DA CONCEICAO'S CHURCH in Nana ward is a brick building. It was opened on the 10th of July 1853 at a cost of about £950 (Rs. 9500), and has room for about 600, and a congregation of about 1950 mostly Portuguese medical practitioners, clerks, shopkeepers, tailors, and house servants. The church has a font, a harmonium, and three altars, a high altar dedicated to the Immaculate Conception of the Blessed Virgin Mary, and two side altars one dedicated to the Sacred Heart of Jesus and the other to St. Francis Xavier. Attached to the church is an Anglo-Portuguese day school with sixty pupils.

Omkareshvar's Temple (23).

OMKARESHVAR'S TEMPLE, on the bank of the Mutha in Somvar ward to the north-west of the city, was built between 1740 and 1760 by one Krishnaji Pant Chitrav from funds raised from public subscription. Bhau Saheb or Sadashivrav Chimnaji contributed £100 (Rs. 1000) a month towards the cost for about six years while the work was in progress. The temple faces east and is reached by a large and imposing gateway in the middle of a high and massive fortified wall built in the Saracenic style. Over the gateway is a small music hall or *nagarkhana*. The gateway leads to a large paved courtyard with side ranges of brick-vaulted rooms, some open and some with doors in which live religious beggars and ascetics. In the centre of the courtyard is the main temple dedicated to Omkareshvar Mahadev with a small shrine in front, not far from the gateway, containing the bull Nandi a seated life-size stone figure. The temple has a main chamber in the centre vaulted on the top in which is set the *ling* about three feet under-ground. Over the vaulted top of the shrine rises a plain conical pinnacle. Round the main chamber is a space covered by eight small brick vaults. Two flights of steps or *ghats*, one from, the main temple and the other from outside the main gate, run north to the river bed. The sandbank between these two flights or *ghats* is used as a burning ground for Brahmans. The temple is held in great veneration. The levels of the different temple doors are so arranged that the water of the river when in flood, just enters and fills the courtyard and the shrine. Unless the *ling* is flooded once at least in the year, the rains are regarded as scanty. In seasons of drought, Brahmans are paid to carry water on their shoulders and fill the shrine, when it is believed Shiv will send torrents of rain. The *hom* or sacrificial offerings of cooked rice and clarified butter with pieces of sacred wood are offered once every year at the temple on a permanent stone altar specially built for the purpose. Attached to the temple on the west is a small garden, formed by reclaiming ground from the river bank by a heavy retaining wall of stone masonry. The temple expenses are met from the income of the garden and a monthly grant of £2 10s. (Rs. 25) from the Parvati temple revenues. The cost of the yearly sacrificial offerings or *horn* is met by a yearly Government grant of £100 (Rs. 1000). The size and solid massiveness of this temple, together with its nearness to the burning ground, make the name Omkareshvar greatly feared by the people of Poona.

Pandhri or Juna Kot (24).

PANDHRI KOT or the White Fort, also called Juna Kot or the Old Fort, is said to have been built by Barya an Arab commandant after Poona was made a Musalman military station in the fourteenth century. The fort stretches from the Dhakta or younger to the Thorla or elder Shaikh Salla [See below Shaikh Salla (31).] along the river bank on the north, and from the Thorla Shaikh Salla to the Mandai market on the west. From Mandai it ran south parallel to the river bank, and a line run from the causeway near the Kumbhar gate eastward to join the southern boundary. A *pipal* tree named Baloba which is still fresh is said to date from early Musalman times. On the break up of the Bahmani kingdom near the close of the fifteenth century Poona fell with most other parts of Poona district to Ahmadnagar. It continued under Ahmadnagar till in 1630 Murar Jagdevrav, a Bijapur minister, is said to have passed a plough drawn by asses over the fort wall and to

have fixed an iron rod in the ground meaning that the town was never again to be peopled. About 1636, after it had remained desolate for six years, Mahmud Adil Shah (1626-1656) of Bijapur raised Shahaji Bhonsla to the command of 12,000 troops and granted him Poona and other villages. In the same year one Malthankar whom Shahaji had appointed his deputy at Poona, passed a golden plough over the fort wall, removed the iron bar, and, to keep off evil, performed a *shanti* or soothing ceremony. These ceremonies are believed to mark the beginning of good luck to Poona.

Parasnath Temple (25).

In Vetar ward is a group of four temples to the twenty-fourth Jain saint PARASNATH, close to each other, two of them in one enclosure. The oldest of Parasnath's temples lay in Kalevavur to the south-west and outside of the city, as the Peshwas would not allow a Jain temple to be built within the city. About 1750 the Jati or high priest of the Jains and Shankaracharya the Brahmanical pontiff happened to meet in Poona. After a long discussion it was agreed, it is said by bribing the Shankaracharya, that a Jain temple might be built in a quarter where Brahmans did not live. The Peshwas granted the site of the present main temple, where two buildings one for Chidambari or Whiteclothed and one for Digambari or Skyclad Jains were built both by public subscription. Of the two sects the Chidambaris or white-robed are the stronger. Both worship naked images but the Chidambaris dress their images with clothes, flowers, and ornaments, while the Digambaris leave the body of their image naked and lay all offerings at the toes of the image's feet. The first two temples were enclosed by a high strong wall and strong gateways which were kept always shut that the noise of the temples might not reach Brahman ears. No spires were allowed as their sight would have polluted orthodox Hindus. The temple of the Humbad or Digambari sect is now in the same state in which it was originally built; but the temple of the Chidambari sect, which is dedicated to Godi Parasnath, proved too small, and the form of the temple, which was more like a private house than a public place of worship, was changed. Encouraged by the religious freedom they had enjoyed since the Peshwa's overthrow in 1818, between 1830 and 1834 the Jains raised subscriptions and built a temple to Rishabhdev the first of the Tirthankars at a cost of £300 (Its. 3000). Since then they have kept adding out-houses to the temple from year to year. The buildings as they now stand contain a chief entrance facing north and two side entrances facing west, one of them leading to the Digambari temple. Over the main entrance is a drum-house or *nagarkhana* and open porticoes or *devdis* are built inside the two other entrances. The main door leads to a long line of upper-storeyed rooms on the left, each of which is a separate temple. The original Chidambari temple, which has now fallen to be a secondary temple is in the middle of these rooms. On the right is the wall of the Digambari temple. Fifty yards more of an open paved passage leads to the enclosure of the main temple which is entered by a door in the north-east corner leading to an open paved courtyard in the middle of which is the main temple. The image chamber or shrine is a solid cut-stone and vaulted room about fourteen feet square and contains five white crosslegged and handfolded marble images set in a row against the back wall, the chief image being Rishabhdev the first Tirthankar. Outside the image chamber, but joined with it, is an octagonal portico, also built of solid stone and vaulted, the inside of the vault lined with small mirrors. The floor is of white marble with a thick black marble border.

The octagon has four side doors one leading to it from the *sabhamandap*, a second coated with brass leading to the shrine, and, two side doors which open on the courtyard. Niches are made in the remaining four sides of the octagon, the two nearest the shrine having small images and the other two having shelves. Outside of this octagonal portico is the wooden hall or *sabhamandap* (40' X 20') with a carved wood ceiling and built on a high atone plinth. At the far end of the hall in a small railed space are two marble elephants. Over the shrine doors and the octagonal portico are rooms with more images reached by narrow stone steps built round the sides of the octagon. Above the rooms side by side are the three symbolical spires of a Jain temple. Behind the temple courtyard is another yard with arrangements for bathing including warm water, for no worshipper may touch the idol until he has washed and dressed in wet clothes. The Jains have a curious mode of raising money for the maintenance of their temples. On holidays and great days when the community meets for worship they put to auction the right of applying saffron or *keshar* to the images and the highest bidder buys the right of first applying it. In this way large sums are raised.

The second temple of Adishvar to the west of the first was begun in 1851 and finished in 1854 at a cost of £1400 (Es. 14,000). The consecration ceremony on the 8th of May 1854 was attended by about 10,000 Shravaks. It is a two-storeyed brick and lime building carved in wood on the exposed parts and surmounted by a treble spire. Each storey has four rooms one behind the other. The ground floor is set apart for daily services at which a priest or *guru* reads and explains the Jain scriptures. On the first floor is the image of Adishvar, and on the second floor are smaller images. The back rooms of all the floors are used as dwellings by the *guru* who must be a bachelor or *Brahmachari*. The temple has been and is being added to from year to year. The third temple is like the second but much smaller. All four temples are gaudily painted and decorated with coloured chandeliers of various shapes and quaint glasses, globes, and other ornaments. Each is managed by a firm of merchants of long standing and established reputation. The monthly cost of all the temples amounts to about £25 (Rs. 250). The jewels and the gold and silver coatings of the chief images are worth about £300 (Rs. 3000) and the cash balances in hand amount to about £500 (Rs. 5000). The Jain holy months are *Chaitra* or March-April, *Shravan* or July-August, *Kartik* or October-November, and *Phalgun* or February-March when fairs are held. A car procession takes place on the full-moon of *Kartik* or October-November.

Phadke's Vada (26).

PHADKE'S MANSION, in Aditvar ward, was built between 1794 and 1799 by Haripant Phadke the commander-in-chief under Madhavrav the seventh Peshwa (1774-1795). The mansion is now more like a small village than a single house as the present owner has turned it into small rented tenements together yielding about £150 (Rs. 1500) a year. The first floor front of the mansion has for more than twenty years held the Free Church Mission Institution. The mansion is two-storeyed with many halls and seven quadrangles or *chauks* two of them large. It is built of massive stone and timber and is said to have cost about £170,000 (Rs. 17,00,000). Water from the Katraj aqueduct is laid on in the back quadrangle.

Purandhare's Vada (27).

PURANDHAKA, a school friend of Balaji Vishvanath the first Peshwa (1714-1720), was made his minister, and was granted a site in the fort for a house. In 1740 his heir Mahadaji Abaji Purandhare built a mansion in the fort at a cost of £5000 (Rs. 50,000) with two large and two small quadrangles. The descendants of the Purandhare family still live in the mansion which is now the only important house in the old fort. The line of the fort walls may still be traced.

Rameshvar's Temple (28).

RAMESHVAR'S TEMPLE in Shukravar ward was built by Jivaji Pant Anna Khasgivale the founder of the ward at a cost of £3500 (Rs. 35,000). The temple has the usual shrine with portico and spire and a wooden hall or *sabhamandap*. The hall was enlarged and rebuilt about 1870 by a rich public works contractor. In 1878 a railway contractor rebuilt the doorway and over it raised a music hall or *nagarkhana*. The contractors paved the whole enclosure including a large well whose top they covered with iron rails and beams of wood. This temple is held in great veneration. Its great days are *Shivratri* in January-February and the bright half *Kartik* or October-November.

Rastia's Vada (29).

RASTIA'S MANSION in Rastia ward is one of the largest remaining mansions in the east of the city. It is surrounded by a high thick wall. The chief entrance is by a plain but handsome square gateway with massive woodwork over which rises a two-storeyed building. Round the inside of the enclosure runs a row of cloisters originally the stables of Rastia's cavalry retinue, now either open or built in and let as rooms to poor families. In the centre of the enclosure is the mansion which consisted of two three-storeyed buildings the mansion and a store-house or *Kothi*, since burnt, with plain thick walls, built round two rectangular court-yards. The mansion with two quadrangles remains and attached to it is a large garden and a Mahadev temple to which a temple of Ram was added in 1882 by the widow of the last Rastia. The temples are stone-built shrines and open porticos surmounted by spires. The Rastias were the hereditary heads of the Peshwa's cavalry and lived at Wall in Satara. The mansion was built between 1779 and 1784 at a cost of £90,000 (Rs. 9 *lakhs*) by Anandrav Bhikaji Rastia in the reign of Madhavrav the seventh Peshwa (1774-1795). An aqueduct brought from a spring in the hills of Vanavdi village four miles south-east of Poona was built by Anandrav immediately after wards at a cost of £20,000 (Rs. 2 *lakhs*) to supply water to the mansion and public cisterns outside.

Sassoon Asylum (30).

The SASSOON ASYLUM, or Poor House, in Narayan ward on the, river Mutha above the Lakdi bridge, is. a home for the aged, infirm, and diseased poor of all classes. It has at present (1883) about sixty five inmates. The asylum was established in 1865 from funds raised by a public subscription amounting to £10,717 (Rs. 1,07,170), the greater part of

which was given by the late Mr. David Sassoon whose name the asylum bears. £3457 (Rs. 34,570) were spent on buildings and of £7260 (Rs. 72,600) which were deposited in the Bombay Bank only £1301 (Rs. 13,010) were recovered on the failure of the bank in 1869-70. Further subscriptions were collected and the fund was raised to over £5000 (Rs. 50,000) which is now invested in Government securities. The asylum is managed by a committee of life members of whom the District Collector is the President. The working body is a managing committee nominated by the general committee with two secretaries. The Poona Municipality contributes £10 (Rs. 100) a month to the asylum. The spacious site of the building was given free by Government. The building stands on a high plinth raised above the flood line and has eleven detached wards, each 33' x 18', with a cooking and dining room (123' x 27'), an office room (43' x 34'), and latrines and out-houses. A medical attendant looks after the health of the inmates, the diseased being kept in different wards to avoid contagion. Of the (1883) sixty-five inmates, seventeen men and eleven women are unable to earn a living from old age; six men and five women are blind; and twenty men and six women are lepers.

Shaikh Sallas Tombs (31).

The two SHAIKH SALLAS, THORLA or the elder and DHAKTA or the younger, are two Musalman shrines or *dargahs* on the river bank in Kasba ward. They stand on the site of two Hindu temples of Narayanesvar and Puneshvar. According to the local tradition, in 1290, Syed Hisa Mohidin Khalal and four other Musalman ascetics came from Delhi, desecrated the two temples, threw away the *lings*, and turned the temples into shrines or *dargahs*. The temple of Puneshvar [The Puneshavar *ling* is said to have been taken to the foot of Purandhar fort where a temple still remains which was built for it.] became known as Shaikh Salla-ud-din's or the younger Shaikh Salla's shrine and the Narayanesvar temple as Shaikh Hisa Mohidin's or the elder Shaikh Salla's shrine. The two Poona villages of Yerandvane and Kalas, whose revenues had been enjoyed by the temples, were continued to the shrines. According to another story the temple priests asked the Bijapur government to restore them the villages. The Bijapur authorities refused unless the Brahmans undertook the saints' worship. On this one of the Brahman priests embraced Islam, was appointed *mujavar* or ministrant of the shrines, and passed down the office to his family by whom it is still held.

Dhakta Shaikh Salla's Tomb.

A pointed arched stone gateway reached by a flight of steps leads to a large enclosure, whose centre is shaded by a vigorous old tamarind tree under whose branches are several small tombs. To the left and right near the outer gateway are rest-houses with strong plain wooden pillars and opposite the door is another higher and more modern rest-house all built of wood. Some chambers to the right have a row of pillars with outstanding deep-cut brackets stretching from their capitals to the roof. In this row of buildings a door, whose posts are thickly covered with old horse shoes, opens into an inner courtyard with several tombs. The tombs to the right are of little size or interest. But opposite the doorway a larger monument, of no great elegance, with some open trellis windows, is said to be the tomb of a grandson of Aurangzeb who is said to have been buried here for a year and to

have been then carried to Aurangabad. Further to the left the large dome with the gilt crescent is the tomb of Shaikh Salla, and still further to the left is a mosque on the site of the Puneshvar temple, whose images are said to be buried under the floor of the mosque. The mosque bears marks of its Hindu origin in three doorway pillars, two of which are old Hindu work, square at the bottom, then rounded, then octagonal, and again square. The door is also Hindu with a Ganapati niche in the lintel. On the left in an open place under a wooden roof are some tombs. Some broken pillars plainer than those at the doorway lie scattered among the graves on the left. Behind the mosque a flight of steps led from Puneshvar's temple to the river bed. In the front courtyard to the left is a tiled building where a bier or *tabut* is kept and where congregations are held for prayer.

Thorla Shaikh Salla's Tomb.

The THORLA or ELDER SHAIKH SALLA'S SHRINE on the site of the Narayaneshvar temple, and containing the tomb of Shaikh Hiss Mohidin, lies on the Mutha below the Mandai market. The tomb, which has a plain doorway, is approached by a flight of steps. The space inside is very uneven and is now a regular burial ground with numerous graves round the central tomb which is a circular domed room. To the east and south-west are remains of old rest-houses. Outside the main entrance and facing the river side is a long building of plain wood work. On the other side are the residences of the tomb ministrant or *mujavar*, and in the middle an open courtyard. A flight of steps leads down the inner enclosure through an archway under the enclosure wall to the river. The ruins of the original Narayaneshvar temple are still scattered about to the south-west of Hisa Mohidin's tomb. They consist chiefly of stone columns and lintels, some in their places and others strewn over the ground. The columns and lintels and the form of the old temple are in the old Hindu style. The villages granted to the tombs are now encumbered and not in the hands of the ministrant family who are badly off.

Shanvar Palace (32).

The SHANVAR PALACE in Shanvar ward, probably at that time (1730 -1818) the finest modern palace in the Deccan, was the chief residence of the later Peshwas. It was so destroyed by fire in 1827 that all that remains is the fortified enclosure wall about 200 yards long by 150 yards broad and twenty feet high. The lower five feet of the wall are built of solid stone and the upper fifteen feet of brick. The wall has eight bastions and five gateways in the Musalman-style the gates with high pointed arches. Of the eight bastions, all of which are of stone below and brick above, four are at the corners and four in the middle of each face the north one having the main gateway. The wall has five gateways. The main entrance in the centre of the north wall is called the Delhi gate as it faces Delhi. The huge wooden door remains thick-set with iron spikes to ward off elephants. The gateway is flanked by large twelve-sided cut-stone bastions with turrets. Above the main entrance is a large hall now used as a record room. Inside the enclosure are lines for the city reserve police and a garden and parade ground. On the north to the east of the main entrance is a smaller gate the name of which is not known. Two small gates in the eastern wall are called the Ganesh and Jambhul gates, the Ganesh called after an image of Ganpati on one side of it and the Jambhul after a *jambhul* or Eugenia

jambolana tree which grew near it. The fifth gate is in the south wall at the western end. It is called the Mastani gate after Mastani the beautiful Muhammadan mistress of Bajirav the second Peshwa (1721-1740) who used to pass in and out of the palace by this gate. Mastani was brought by Chimnaji Apa from Upper India and presented to the Peshwa. She was a noted beauty and the Peshwa was extremely fond of her. Large landed property and buildings were granted to her and a garden in the city still goes by her name.

The site of the Shanvar palace was chosen by the second Peshwa Bajirav Ballal (1721 - 1740), who, according to the well worn story, when riding, saw a hare turn on a dog and thought that a house built on that site would never be taken. The site, which is about 4½ acres, was cleared of Koli and other huts and the foundation stone was laid by Peshwa Bajirav on the new moon of the Musalman month of Rajab in 1729. Part of the foundation-laying ceremony is said to have been the burial of a live Mang. Shahu (1708-1749) of Satara told the Peshwa not to put the main entrance to the north as it would mean a war with Delhi, the Moghal capital, of whose ruler Shahu always considered himself a vassal. In deference to Shahu's wishes the building of the gate was stopped and it was not completed till after Shahu's death (1749) by the third Peshwa Balaji Bajirav (1740-1761). The palace was a six-storeyed building with four large and several smaller courts or *chauks*. The courts were called either from the objects for which they were set apart or the persons who occupied them. One was called Phadacha Chauk or the Granary and Stores Court, a second Tak Chauk or the Dairy Court, a third Mudpak Chauk or the Kitchen Court, a fourth Pakvanna Chauk or the Sweetmeat Court, and two others Savitribai's and Yamunabai's Chauks after two ladies of the Peshwa's family. The halls or *divankhanas* of the palace had names taken either from their decorations or from their uses. One was called the Gokak Divankhana, because it was embellished with toys and decorations from Gokak in Belgaum; another the Nach Divankhana where dancing parties were given; a third the Kacheri Divankhana or audience hall, where statesmen and strangers were received; a fourth the Hastidanti Divankhana or ivory hall because of an ivory ceiling and other decorations; the fifth the Ganesh Divankhana where Ganpati was yearly worshipped in *Bhadrpad* or August-September; a sixth the Arse Mahal because its walls and ceiling were covered with mirrors; and a seventh, Narayanrav's Mahal because it was specially built for the fifth Peshwa Narayanrav (1772 -1773). These and other halls were in the form of a standish or *kalamdan* with a central main hall with square ceiling, and side compartments with sloping ceilings like the aisles of a church. The pillars supporting the main halls were of wood cut in the cypress or *suru* pattern and were joined together on the top by thick cusped arches. The ceilings were covered with beautiful wooden tracery in different patterns. The wood work was painted with figures of trees and men or scenes from the Purans in enamel and gold. The stone work inside the courts was throughout finely chiselled and polished. Most of the important courts had central fountains. [The seventh Peshwa Madhavrav II.(1774- 1795) threw himself from the uppermost floor on one of the-fountains, broke both his legs, and died after two days' illness.] The height of the palace is not known. It is said that the spire of Alandi temple twelve miles north of Poona was seen from the uppermost terrace. All round the palace thick iron chains were hung on the walls to ward off lightning and other evil spirits. A retinue of Brahman servants was maintained at the palace at a monthly cost of £150 (Rs'. 1500). From a cistern in the palace water was raised to the seventh storey and carried to

the Mudpak court, Tak court, and other parts of the palace. The fountain in Phad court was famous for its size and beauty. The story is told that, while the palace was building, no one thought of the water-supply except a skilful mason who stealthily built a duct under the wall and made a reservoir near the Ganesh gate. When the palace was finished and the Peshwa was arranging to bring water from the Katraj aqueduct into the palace he saw no way except by pulling down a part of the enclosure wall with the building on it. The mason showed his duct and was rewarded for his foresight by the grant of a village near Ahmadnagar where his descendants still live. In 1755 stone towers were built over the gateways. In 1788 the Phad court was rebuilt under the superintendence of Nana Fadnavis. In 1811 an Asmani Mahal or Sky Hall built by Bajirav the last Peshwa (1796-1817) was burnt down. In 1827 on Thursday the bright sixth of *Phalgun* or March-April the palace- caught fire, and continued burning about a fortnight. In spite of all efforts, almost the whole of the palace was destroyed. Among the parts saved was the Mirror Hall which has since been removed. The palace site is now used for the reserve force of the Poona city police.

Shukravar Vada (33).

The SHUKRAVAR PALACE in Shukravar ward was built by Bajirav the last Peshwa in 1803-4. It was partly burnt in 1820 and the ruins were sold by Government. No trace but the bare walls remains. This was a small building with two courts and two upper storeys. It was Bajirav's private residence.

Someshvar's Temple (34).

SOMESHVAR'S TEMPLE in the Aditvar ward was built by Narayanrav Natu about 1830. It has become a great resort for wandering Gosavis. The temple is now (August 1884) being rebuilt by public subscription among the Marwari shopkeepers in the Kapadganj market who have already given about £3000 (Es. 30,000) The body of the temple is being built of polished trap with marble columns and terraced windows. The original image chamber is preserved and is being lined with masonry. The hall will be built of carved wood. A public cistern has been built in the yard and a small garden has been made at the back. Along the sides are rest-houses for Gosavis. The doorway with a small drum-house or *nagarkhana* over it has been recently rebuilt. The *ling* of this temple is a natural knob of rock like the Omkareshvar *ling* and is held in high veneration. The great day of the temple is *Mahashivratra* in February-March. The temple expenses are met by subscriptions among the traders of Kapadganj.

Tambdi Jogeshvari's Temple (35).

JOGESHVARI was one of the oldest guardians of the city and had a temple about a mile to the north of the town when it consisted of about a dozen huts. The goddess, who is now painted red and called Tambdi or Red Jogeshvari, is formally asked to all marriage and other important family ceremonies. The temple is very plain and built of solid stone with a shrine and a small hall in front. On the sides are platforms with images of Vithoba,

Mahadev, and Ganpati. The holy days of the temple are the *Navratra* in September - October.

Tulsibag Temple (36).

TULSIBAG TEMPLE in Budhvar ward, was built in 1761 by order of the third Peshwa Balaji Bajirav (1740 -1761). The temple stands on the site of a garden of basil or *tulsi*. Close to the garden a stream now dry passed by the Red Jogeshvari's temple. A trace of the stream remains in a woman's tomb behind the Tulsi Garden which must once have been on the bank of the stream. The building of the temple was superintended by Naro Appaji who was also made the temple manager. The Tulsibag is about one acre in area and is entered by a small door. It contains three temples, one of Ram in the middle, of Ganpati on the right of Ram, and of Shiv on the left. Ram's temple consists of a cutstone and vaulted shrine with a spire and an arcaded portico with a marble floor. Ganpati's and Mahadev's temples are also of cutstone but smaller and without the portico. In front of the temple a yard laid out in flower beds is crossed by paved footpaths which lead to the different temples. Behind the temples are two detached halls beyond one of which is a basil pillar. Below the pillar is a four-armed stone image of Vishnu lying on the serpent Shesh. In front of Ram's temple is a third large hall about twenty feet high with a wood-carved ceiling and a fountain. Ram's temple has three white marble images of Ram Sita and Lakshman. In front of Ram in a small stone shrine is a black-stone standing image of Maruti with folded hands. Over the north and south gateways are two drum-houses or *nagarkhanas* where drums are beaten daily at morning evening and midnight and in addition at noon and afternoon on Saturdays, the day on which Poona passed to the Peshwas. Additions and alterations, at a cost of about £3000 (Rs. 30,000), have lately been made to the temple by Mr. Nandram Naik. A very elegant new conical cement spire 140 feet high and ornamented with figures foliage and niches has been built; and the third hall or *sabhamandap* (60' X 40' x 20') has been rebuilt of massive wood. Tulsibag is the most frequented temple in Poona. It enjoys a grant for the maintenance of the drum-house from the Parvati temple revenues and has shops and houses whose rents go towards its expenses.

Vetal Temple (37).

The temple of VETAL or the Ghost King in Vetal ward, is an ordinary looking and popular temple with a shrine, a chamber, and an outer hall. Round the outside of the temple runs an open air passage about six feet wide, and round the outside of the passage is a row of rough undressed stones about six inches high covered with whitewash and tipped with redlead. The north and west walls of the temple are also marked with great patches of redlead and whitewash. Near the entrance door is a small altar where a lamp burns and where are impressions of Vetal's feet and a small Nandi or bull. Low caste people do not go further; they bow beside the feet and look at Vetal. From the roof of the shrine or chamber at the west end of the hall hangs a bell, which, according to the temple ministrant, one of the Peshwas presented to Vetal in fulfilment of a vow that he would offer Vetal a bell if the casting of a certain cannon was successful. The god is a red block about three feet high and three feet round. The top is roughly made into the shape of a

man's face with large eyes and a black moustache. It is thickly encrusted with redlead. On the top of the head is a small wreath of chrysanthemums. From the roof hangs a garland of *bel* or *Egle marmelos* and custard apple leaves and marigold flowers, and across the door is a string of dry mango leaves. The god is washed every day, but no light is burnt near him. Friday is his big day. The god is a pillar of cement built over a round undressed stone, which, about ninety years ago, a Maratha brought from the village of Bapgaon in the Purandhar sub-division. His great-grandson is the present ministrant or *pujari*. All classes of Hindus, Brahmans as well as other people, worship this Vetāl. Vetāl is worshipped in the same way as Bahiroba and other Maratha gods. Goats are sacrificed to him in fulfilment of vows; cocks are not offered. Vetāl's chief worshippers are athletes and sorcerers.

Vishnu Mandir(33).

VISHNU MANDIR or Vishnu's temple in Gosavipura in Somvar ward is one of three charitable works built in 1846 at a cost of £13,000 (Rs. 1,30,000) by a wealthy Gosavi named Bava Narpatgir Guru Kisangir who died in 1859. To remedy the deficient water-supply of Gosavipura Bava Narpatgir laid a branch from the Katraj aqueduct and built public cisterns, this temple, and a rest-house. [In reward for his public spirit Government presented the Bava with a gold bracelet.] The work was begun in 1846 and finished in 1850. The temple consists of a small solid stone room about twenty feet square with a vault surmounted by a conical tower. The objects of worship in the room are images of Vishnu and Lakshmi. The tower is richly ornamented with foliage, niches, and mythological figures in stucco. In front of the room is an arched stone portico. Touching the portico on a lower level is a large wooden hall or *sabhamandap* open on the north. The hall has a central nave and aisles. To the north of the temple is a paved quadrangle surrounded by open wooden pillared halls. To the north of the first quadrangle is a second with rooms and halls on the sides. The first quadrangle has a neat little fountain and outside the temple premises are two large public cisterns Bava Narpatgir has endowed the temple cisterns and rest-house with lands yielding £50 (Rs. 500) a year.

Vishnu's Temple(39).

VISHNU'S TEMPLE in Shukravar ward was built by Jivajipant Anna Khasgivale. Behind the temple is a water cistern or *haud* from which Brahmans alone are allowed to draw water. Beyond the cistern was a garden belonging to Khasgivale with a dwelling surrounded by fountains. The garden, dwelling, and fountains have been removed and the site taken by the Poona municipality for the central market.[See above pp. 337-338.] The temple is in two parts, a shrine and a portico, both built of solid stone and vaulted with a spire. In front is an open wooden hall or *sabhamandap* with a tiled roof where Purans are read every evening to large numbers of people.

Vishrambag Palace(40).

VISHRAMBAG PALACE in Sadashiv ward, now used for the Government High School, is a large one-storeyed mansion, 260 feet long and 815 feet broad. The palace has three

quadrangles or *chauks* each with open halls on all sides on the ground-floor and enclosed rooms with numerous windows on the upper floor. The chief supports on the ground-floor are all of wood, cut square and placed on stone pedestals. The beams and girders are also of wood, cut and dressed square. The columns of the upper floor are also of wood carved in the cypress or *suru* form. The columns have a square base and rounded top. The shafts are round but bulge out a little at starting and taper at the head. The entablature is nearly the same as the base inverted though smaller. Above the entablature the column runs square and receives the square post plate and over it the beams. The space between the post plate and the entablature is filled by a false wooden arch. The arch is cusped and horse-shoe shaped, the centre raised in a point by turning up the ends of the two uppermost cusps of the arch. The shafts are carved with the stalk and leaves of creepers and the base and entablature are enriched with foliage. The arches start from the stem which carries the flower and fruit of the creeper. The palace roof was originally a terrace, but it has been lately made into a tiled roof. The quadrangles or *chauks* are well paved squares with ample room for lectures and other meetings. The hindmost quadrangle contains three small cisterns placed in a line in the centre and fed by the water of the Nana Fadnavis aqueduct. Outside the palace is a large public cistern called Pushkarni. The palace was built as a residence by Bajirav the last Peshwa between 1803 and 1809 at a cost of £20,054 (Rs. 2,00,540). The aqueduct and cisterns cost a further sum of £850 (Rs. 8500). The palace was furnished at a cost of £1400 (Rs. 14,000), and an establishment at a monthly cost of £40 (Rs. 400) was kept to guard it and attend the Peshwa when he lived there.

On the recommendation of Mr. Chaplin, Commissioner of the Deccan (1818-1821), Government set apart £2000 (Rs. 20,000) out of the Dakshina Fund,[Details of the Dakshina Fund are given above under Instruction pp.48, 62. 64.] to maintain a college for the study of the Vedas and Shastras. The college or Pathshala was started in this palace in 1821. About 1842 the study of the Vedas was stopped and classes for teaching English were substituted, with the late Major Candy, the author of the Marathi Dictionary, as the head of the college staff. The study of the Shastras was stopped in 1856 and the first Deccan College was formed with a preparatory school attached. In course of time (1868) the very handsome Deccan College buildings now in use were completed. The preparatory school which then became the High School has since remained in the Vishrambag palace. In May 1879 the front quadrangle of the palace was burnt down by incendiaries. Public subscriptions, aided by municipal contributions, were raised and the buildings restored somewhat to their original appearance. It is intended to make the restoration complete.

Miscellaneous.

Besides the above the following buildings may be noted. In Aditvar ward, Ghorpade's mansion with a large public cistern and a *jalmandir* or water-house that is a house built on pillars in water. In Budhvar ward Mankeshvar's palace now owned by the Kibe banker of Indore, and Thatte's temple of Ram; in Ganj ward Raje Bagsher's mosque; in Kasba ward Nana Fadnavis mansion where the Peshwas' records are kept; in Narayan ward the Gaikvad's mansion the Lakdi bridge and Vithoba's temple; in Shanvar ward Appa

Balvant Mehandale's mansion, Chandrachud's mansion, Gadre's mansion owned by the Dowager Rani of Baroda and now occupied by the New English School, Harihareshvar's temple, Holkar's mansion, Jamkhandikar's mansion, Sanglikar's mansion, and Shirke's mansion. In Shukravar ward Bara Imams' or the Twelve Saints' mosque, Bhau Mansaram's mansion built by a rich contractor Bhau Mansaram in 1869, and Nandram Naik's mansion built in 1859 both favourite resorts of Maratha chiefs visiting Poona on business or pleasure, and the Pant Sachiv's mansion; and in Vetar ward Chaudhari's mansion now in possession of Rav Saheb Bhajekar, and the S. P. G. Mission house and church.

Cantonment.

The Cantonment, the eastern section of Poona, has an area of about 425 square miles, about 30,225 people, and during the five years ending 1883, an average yearly cantonment revenue of about £6664 (Rs. 66,642). [The details are: Rs. 21,635 in 1879-80, Rs. 24,840 in 1880-81, Rs. 85,507 in 1881-82 Rs. 1,08,394 in 1882-83, and Rs. 92,837 in 1883-84.] It is a rectangular plot of land about 2.72 miles from north to south and varying from 1.36 to 1.62 miles from east to west. It is bounded on the north by the Peninsula railway, on the east by Bahiroba's stream, on the south by a line drawn from the Vanavdi Hay stacks past the back of the Military Prison (85) to the cemetery on the Satara road (59), on the south-west and west by the Bhavani and Nana wards of the city, and on the north-west by the line of the Council Hall road which separates it from the suburban municipality.

Divisions.

Almost along its whole length to the Right Flank Lines in the extreme south, the central belt of the Military cantonment, with an area of 130 acres, is kept open for parade and other military purposes. Beyond this central open belt to the north-east are the Ghorpadi Lines and Barracks, to the south-east the Vanavdi Lines, to the south the Right Flank Lines so called because they are on the right flank of the cantonment, to the south-west the Neutral Lines and the Petty Staff Lines, to the west the Native Infantry Lines and behind them the Sadar Bazar, to the north-west the Ordnance Lines and behind them the Staff Lines. Beyond the natural limits of the cantonment, but under the control of the Cantonment Magistrate, in the extreme north-east on the right bank of Bahiroba's stream, between the Peninsula railway and the river, are the Native Cavairy Lines.

Aspect.

The land in the cantonment forms two parts, the central belt most of it of poor soil and rock, bare of houses, and with few trees except those that line the roads which cross and encircle it; and the groups and lines of residences chiefly of European civil and military officers in the Ghorpadi lines in the north-east, in the Vanavdi Lines in the south-east, in the Right Flank Lines in the south, and in the Neutral, Native Infantry, and Staff Lines in the west and north-west. All of these quarters or lines are well provided with excellent roads some of which have road-side trees and riding paths. Most of the houses are in

enclosures of half an acre to two acres fenced with brick walls or low cactus hedges. Many of the enclosures are bare of trees. Others, especially during the rains, are shady gardens well stocked with shrubs, roses, geraniums, and flowering plants and creepers. With a few exceptions the houses are one-storeyed buildings, on plinths two to five feet high with stone and cement walls and tiled roofs. A few are owned and held by wealthy Natives but most are owned by Natives of Poona and let to Europeans, chiefly Civil and Military officers at monthly rents of £5 to £15 (Rs. 50- 150) or £80 to £120 (Rs. 800 - 1200) for the rainy season. Each house has its line of stables and servants' quarters generally of brick. Besides these lines the cantonment limits include two lines of small houses with small front gardens and paying rents of £2 10s. to £7 10s. (Bs. 25 - 75) a month. These are the Ordnance Lines to the north-east of the Native Infantry Lines and the Petty Staff Lines to the south-west of the Neutral Lines. The residents of these lines are chiefly European and Eurasian pensioners and Government servants. The nine lines within cantonment limits have 4451 people of whom 981 are Europeans and the rest (3470), chiefly their servants, Goanese, Musalmans, and Hindus.

Sadar Bazar.

To the left of the Native Infantry lines is the Sadar Bazar or chief market a town (1883) of 2491 houses, 705 shops, and 17,813 people, which has sprung up since the beginning of British rule. The main thoroughfare is a fine broad street with open paved gutters, broad footpaths lighted with kerosine lamps, and shops shaded by fine trees.

Houses.

Some of the houses are small and poor with low front walls. Most are two-storeyed many of them built on a plinth, with a receding ground floor and pillars at the edge of the plinth supporting an overhanging upper storey with projecting beams generally without carving. In other houses the ground floor comes to the edge of the plinth and in the upper storey is an overhanging balcony. Besides these single and two-storeyed houses are handsomer buildings three or four-storeys high, with fronts of rich strong wood work with fine rounded pillars and deep overhanging balconies and verandas with iron railings.

The owners of the Sadar Bazar houses are Hindu traders chiefly Gujarat and Marwar Vanis, Shimpis, Telis, and Kamathis, and of the poorer dwellings domestic servants to Europeans. Next in number to the Hindu houseowners come Muhammadans, Mehmans, Bohoras, mutton and beef butchers, dealers in poultry, Government pensioners, and domestic servants to Europeans. Parsis, who come next in number, own the best dwellings and are the chief traders. The Portuguese who are chiefly Government clerks own some well built though small dwellings. They are principally medical practitioners druggists and shopkeepers. Goanese and Native Christians chiefly bakers also own houses and live in them. Monthly house rents in the Sadar Bazar vary from 2s. (Re. 1) for a hut to £1 10s. to £2 (Rs. 15 - 20) for an ordinary dwelling. Shop rents vary for small shops from 10s. to £1 10s. (Rs. 5-15) a month and for large shops rise to as much as £5 (Rs. 50). Single lodgings or rooms are usually let at about 2s. (Re. 1) month. During the past few years rents have risen and are now (1885) high.

Shops.

In 1883 the Sadar Bazar had 705 shops of which 114 were grocers, fifty-five Bohora cloth sellers, forty-nine mutton butchers, forty-six retail country liquor sellers, forty-five shroffs or money lenders, thirty-eight beef butchers, thirty-five vegetable sellers, thirty-five betelnut sellers, thirty-five tailors, thirty cloth sellers, twenty-seven goldsmiths, twenty-four fruit sellers, twenty-two wholesale Europe liquor sellers, eighteen carpenters, fifteen retail bakers, thirteen palm-liquor sellers, thirteen glass bangle-sellers, twelve wholesale bakers, twelve fish sellers, nine sodawater and lemonade sellers, five private dispensaries, five bookbinders, four perfume sellers, four cigar sellers, four ironsmiths, four watchmakers, three salt-meat sellers, three booksellers, two tent-makers, two glaziers, two workers in tin, two photographers, and one ice-seller. Besides the five private dispensaries which were owned by Portuguese and Hindus, a charitable dispensary for medical advice and treatment is maintained at the cost of the cantonment fund. As regards the caste or race of the different classes of shopkeepers the photographers and the ice-maker were Parsis, the tailors and tent-makers Maratha and Kamathi Shimpis, the boot and shoe makers chiefly Pardeshi and Telangi Mochis, the glaziers and carpenters Parsi Hindu and Musalman carpenters, the palm-liquor sellers Parsis Marathas and Kamathis, the grocers chiefly Gujarat and Marwar Vanis, the cigar-sellers Goanese and Madras Hindus, the Atars or perfume sellers Muhammadans, the wholesale Europe liquor sellers chiefly Parsis, the bakers almost all Goanese, the goldsmiths Pardeshi Maratha Gujarati and Telangi goldsmiths, the sodawater and lemonade sellers mostly Hindus, the cloth-sellers chiefly Mehmans Gujarat Vanis and Shimpis, the beef and mutton butchers Muhammadans, the vegetable sellers Hindus and Muhammadans, and the fish sellers, some of whom import fish from Bombay in ice, Parsis and Hindus, in addition to these 705 ordinary shops are eleven large shops, one a branch of a joint stock company, six owned by Europeans, one by a Hindu, two by Parsis, and one by a Musalman. [The branch of the joint stock company is Treacher and Co. 's general merchants chemists and druggists; the six European-owned shops are Badham Pile and Company clothiers, Mrs. Hunt and Mrs. Taylor milliners, Mr. J. Farbstein hair cutter, Marcks and Company watchmakers, Phillips and Company chemists, and Watson and Company general merchants; the one Hindu-owned shop is Morgan and Balkrishna chemists druggists commission agents and auctioneers; the two Parsi-owned shops are Cooper and Company booksellers and stationers, and Orr and Hirjibbai saddlers boot and shoemakers commission agents and auctioneers; and the one Musalman-owned is Ludha Ibrahim and Company general merchants and auctioneers.]

During the south-west monsoon that is between June and October several European and native tailors, milliners, and dress makers come from Bombay to Poona. Of liquor shops in the Sadar Bazar twenty-two sell wholesale Europe spirits wine and beer, and forty-six shops retail country liquor and thirteen shops retail palm liquor or toddy. Country liquor is distilled by a contractor at a distillery, which is under Government supervision, about four miles east of the cantonment. Palm liquor is brought from the neighbourhood of Poona by a contractor who pays Government a certain sum for the monopoly of the sale within a certain area. The country spirits are chiefly distilled from *moha* or Bassia

latifolia flowers and sugar. The tavern keepers are Parsis, Hindus, and some Muhammadans. The business is brisk and lucrative.

Population.

Except [Contributed by Mr. S. Kyte, Police Inspector, Poona.] a few poor European pensioners the Sadar Bazar is peopled by Natives. They are of two classes outsiders and locals. The outsider classes are chiefly Parsis from Bombay, Bohoras from Gujarat, Mehmans from Cutch, and Vanis from Gujarat and Marwar. The chief local classes are Brahmans, Buruds, Chambhars, Kamathis, Malis, Marathas, Mochis, Shimpis, and Sonars. The outsiders are rich and prosperous, the locals are chiefly craftsmen who, though well-to-do, have not risen to wealth.

Outsiders.

The first Parsis who settled in the Sadar Bazar came from Sirur in East Poona in 1818 when the bulk of the British troops were moved from Sirur to Poona. They opened four Europe shops in thatched huts. The first to build a permanent shop was one Mr. Motabhai and the others followed his example. The richest of them was Bejanji Canteenvala the maternal grandfather of the present mail contractor Mr. Framji Ardeseer who built a large shop in the Sadar Bazar and at Kirkee. The Parsis now form a prosperous community. They live in Main street and deal chiefly in European liquor, oilman's stores, and groceries. Others are watchmakers, carpenters, bookbinders, coach-builders, house-painters, hotel-keepers, and clerks. A few are men of property who live on the rents of lands and houses. The traders order almost all their stores from England and the continent of Europe. Their chief patrons are Europeans and Eurasians. Bohoras, Shia Musalmans chiefly of Gujarat origin, came to the Sadar Bazar soon after it became a British camp. They are said to have begun by selling raw cotton. They now deal in piece goods, oilman's stores, crockery, hardware, and glass. They never sell liquor or lend money. The Mehmans, who are Sunni Musalmans of Cutch, settled in the Sadar Bazar in 1835. They had traded with Europeans in Cutch and, finding them profitable patrons, followed them to Bombay and from Bombay to Poona. They began as hawkers seling piece goods muslins and woollens. Later on they dealt in oilman's stores, and they now sell English millinery, harness and saddlery, plated ware, crockery and glass, piece goods, furniture, and horses and carriages. They do not sell liquor or lend money. Some live on incomes drawn from land and house property. They deal direct with England and the continent of Europe. Vanis or Baniyas were the first settlers in the Sadar Bazar and are now the largest body of traders. They are of three classes, Gujarat Marwar and Lingayat Vanis, all hardworking and moneymaking. The Lingayats have the best name for fair dealing; the Gujaratis and Marwaris are hated for their hard greedy ways. Most of all three classes deal in grain and pulse. Others trade in piece-goods both European and local, and a few mostly Gujaratis do nothing but lend money. Borrowing from these Vanis leads many Eurasian youths to ruin. Grain dealers buy wholesale from city traders and sell retail in the cantonment. Besides dealing in grain they generally sell tea, coffee, sugar, tobacco, and kerosine oil which they bring from Bombay. The piece-goods dealers bring most of their goods from Bombay. They sell to Europeans and Eurasians, but their chief

customers are low class Hindus. Lingayat and Gujarat Vanis generally begin life by taking service with a dealer or shopkeeper of their own class. They save and lay by and start on their own account. A Marwari generally begins by carrying a sack of parched grain which he barter for old iron and broken bangles. He is a great child-tempter giving children parched grain and sometimes a copper or two for any little article they may pilfer from their parents' houses. After a time the Marwari opens a small shop and saves by the practice of the strictest thrift.

Local Classes.

Of the nine local classes Brahmans, most of whom are Deshasths, are a small body. Shrinking from risk spoils them as traders. Craft and thrift are their two leading money making traits. Most are clerks in Government and private service Buruds or bamboo workers, who live chiefly in Main street, make wicker and basket work and matting. The women earn as much as the men, who, though orderly and hardworking, are given to drink. Chambhars or Leather workers are a poor Marathi-speaking class. They make *chaplans* or sandals, and Deccan Brahman shoes *called jodas*. Their women help by lining the upper part of Brahman shoes with silk. They are poor, partly because they have a caste rule against making English boots and shoes. Kamathis are a class of Telugu-speaking craftsmen and labourers who live chiefly near Malcolm's pond. They are of many castes but the largest class are Kamathi flower gardeners or Phul Malis who do not grow flowers but work chiefly as masons and contractors. The men though active and clever are often careless and dissipated, sometimes kept by their wives who are excellent workers. A few Kamathis have risen to be clerks. Malis, who belong to the Phul Mali or flower gardener division, do nothing but grow flowers. Though poor they are frugal and live within their means. Marathas are a large but poor class. Some are petty shopkeepers selling mutton liquor and betelnut and tobacco. Many are husbandmen and market gardeners, and this section has greatly prospered since the opening of the Khadakvasla canal. But many, perhaps one-half, are idle and debauched. Mochis or Shoemakers are of two classes Madrasis and Pardeshis. The Madrasis, whose home tongue is Tamil, are excellent workmen both as boot and shoe and as harness makers. Chiefly through their skill Poona made European boots are in demand all over the Deccan and in Bombay. They are highly paid and might have constant employment, but they are idle and given to drink. Most of them always spend some drunken days after getting their wages. They eat flesh, including beef, daily, and have lately taken to coffee drinking. Pardeshi Mochis from Bengal speak Hindustani at home and are generally single. They are clever workmen making boots and shoes for Mehmans, who send them to Bombay and other parts of the Presidency. They eat flesh except beef, and drink liquor. Shimpis or Tailors are of two main classes Namdevs and Jains, and among Namdevs are two divisions Marathas and Telangis. The Namdevs and Jains are bitter rivals according to the Namdev saying 'Spare a serpent, not a Jain Shimpi.' Most of them live in Main street. They are hardworking and careful but given to drink. Their chief business is selling cloth and clothes. Sonars or gold and silver smiths, some of whom are Panchals or anti-Brahman Sonars and others ordinary Maratha Sonars, live chiefly in Main street. They have good employment both from Europeans and Natives and are well-to-do.

Streets.

The Cantonment has eight principal streets, East, Main, Centre, Grain Market, West, Sachapir, Dadabhai Bhootee, and Sholapur and Bhavani Peth Roads. East street, 4200 feet long, contains the principal shops for the supply of Europe goods and articles of dress and clothing. Main, street, 4680 feet long, contains 347 houses. The larger Bohoras' shops and tailoring establishments and sellers of Europe spirits wines and beers are established in this street. Centre street, 2280 feet long, contains 239 houses with shops of Vani grocers. Grain Market street, 480 feet long, contains twenty-eight houses chiefly occupied by grain dealers. West street, 3420 feet long, is a great thoroughfare to the west of the Sadar Bazar running from north-west to the south of the bazar, beginning at the Jamsetji fountain and terminating south of the Malcolm pond. Sachapir street 1800 feet long and containing, eighty-one houses is one of the approaches to Poona city from the cantonment. Dadabhai Bhootee street, called after its chief resident Mr. Dadabhai Bhootee, is 1980 feet long and contains thirty-two houses. The large Gavlivada in the old Modikhana quarter lies to the north of the street. Sholapur road 2040 feet long has the Government Bakery and the large business buildings of Messrs. Morgan and Balkrishna, auctioneers and merchants. To the south of the road near Messrs. Balkrishna's premises is a neat row of buildings used as residences and shops. Bhavani Peth road, 720 feet long, contains twenty-six houses chiefly occupied by Marwar moneylenders.

Management.

The management of the cantonment is in the hands of a cantonment committee of thirteen members, nine official and four non-official, under the presidency of the Officer Commanding the Station and with the Cantonment Magistrate as Secretary. [The official members are: The Collector and District Magistrate, the Divisional Deputy Surgeon General, the Executive Engineer, three officers in monthly rotation Commanding Regiments stationed at Poona, the Civil Surgeon, the Executive Engineer for Irrigation, and the Cantonment Magistrate.] Subject to rules passed by Government this committee at monthly or more frequent meetings fixes the strength and the pay of the cantonment staff. Under the control of the committee, the Cantonment Magistrate as executive head manages the conservancy and sanitation of the cantonment which for conservancy purposes has been divided into eleven wards. The conservanoy staff clean private latrines and remove nightsoil from private houses at a monthly charge of 6*d.* to 1*s.* (4-8 *as.*) from each house. [The strength of the conservancy staff is 103 road sweepers and 96 nightsoil men, supervised by twelve supervisors or *mukadams* and two inspectors.] In all parts of the cantonment, not in the charge of regimental or other special establishments, the cantonment conservancy staff remove all filth and rubbish from the public roads and streets, from public latrines slaughter-houses and other places, from receptacles provided for filth and rubbish, and from public and private premises to the committee manure yard about half a mile east of the Sholapur bridge and north of the Sholapur road beyond the new cemetery (60). From the cantonment fund the Sadar Bazar and other parts of the cantonment are kept clean. The Sadar Bazar streets are lighted by 456 kerosine lamps, the posis made of iron in Bombay and the lanterns, also of iron, in Poona. The streets are provided with surface drains which are twice flushed daily to carry off house sullage, the

water draining into the Manik watercourse or *nala*. Eight large public cisterns for free drinking water, three stand-pipes two at Ghorpadi and one at Vanavdi, and large sheds of fourteen blocks containing 428 stalls, five containing 144 stalls in Sholapur Bazar and nine containing 284 stalls in Old Modikhana near Dadabhai Bhootee street for milch cattle, have also been provided. There are two slaughter houses, one for bullocks and cows, the other for sheep and goats. The buildings are close to the Government slaughteries south of the Military Prison (85) on the road to Kondva village. The daily average of animals slaughtered is, in the fair season, sixty-five sheep and goats and eighteen cows and calves; and in the monsoon 120 sheep and goats and eighteen to twenty cows and calves. In the west and north-west the roads are daily watered during the dry months, and the most frequented roads are, in dark nights, lighted by 456 kerosine lamps. ID 1883-84 the cantonment had, including a balance of £6797 (Rs. 67,970), an income of £16,081 (Rs. 1,60,810), and an expenditure of £15,907 (Rs. 1,59,070). The chief sources of income are octroi duties and property rates, licenses, and fees and passes; the main charges are under conservancy, public works, and lock-hospital.

Garrison.

The normal strength of the Poona garrison is 4620 of whom 1165 are Europeans and 3455 Natives. The accommodation for troops in Poona provides for a garrison of two European Infantry regiments, one Mountain Battery, one Native Cavalry Regiment, and three Native Infantry Regiments. Of these troops the two European Infantry Regiments are in the Ghorpadi and Vanavdi Barracks, details of which are given below under Objects (70 & 116). The Mountain Battery is in the old Horse Artillery Lines about half a mile south-east of the Vanavdi Barracks. The Native Cavalry Regiment is in the Native Cavalry Lines about three quarters of a mile north-east of the cantonment (109). The three Native Infantry Regiments are in the right flank, centre, and left flank lines between the Vanavdi and Ghorpadi European Barracks. There are also, besides Commissariat buildings, the Transport Lines about three quarters of a mile west of St. Mary's church (109). For the treatment of European troops there is one Station Hospital in the Vanadi Lines and one small Staff Hospital. Each of the Native Regiments has its own hospital. There is also a first class Lock Hospital with a medical officer in charge and 224 registered prostitutes. The Lock hospital rules are in force within three miles of the cantonment. [Benson's Compendium of Information regarding Poona, 15-16, 22-23, 26,43.]

History.

The [Contributed by Mr. A. H. Plunkett.] Poona cantonment dates from the battle of Kirkee and the capture of Poona city on the 5th and the 17th of November 1817. After the capture of the city the troops were encamped in tents on the spot now called the Ordnance Lines. The troops were attended by Vani grain dealers and other traders whose two lines of thatched huts, now in Main and Tabut streets, were the beginning of the Sadar Bazar. As has been noticed under population the next additions were Parsi traders from Sirur and Bohora Musalman traders from Poona soon after the market was started, and Mehman Musalmans from Cutch about 1835. The Sholapur Bazar, about 500 yards south-east of

the Sadar Bazar, was started at the same time (1818) by the Madras Pioneers whose camp was on the site of the present Transport Lines. The break up of the Queen's Bazar on the site of the Vanavdi Ball Alley further strengthened the Sholapur Bazar. The Vanavdi Bazar was established about 1825 near the site chosen for an encampment of a brigade of Artillery. About this time Bishop Heber mentions the cantonment as lying on raised ground to the east of the city. The streets were wide and the cantonment well arranged and handsome. There was a good station library for soldiers and another for officers, regimental schools, and a spacious and a convenient church but in bad architectural taste. [Narrative, II. 208 - 209.] The Ghorpadi Bazar was started in 1844 on the spot where the Ghorpadi hospital stands. It was afterwards moved east to its present site. Behind the Council Hall (52), on the site afterwards held by the Sappers and Miners, a native cavalry regiment was stationed and a bazar sprang up. All traces were cleared away in 1882 when the Sappers were moved to New Jhansi (88) in Kirkee. Barracks were built at Ghorpadi in 1842, 1849, and 1880, and large double storeyed barracks at Vanavdi between 1861 and 1872.[The details are given below under Objects (70 and 116).] The first houses for regimental officers were built on the site of the present Native Infantry lines. The houses at first were temporary thatched buildings made by Parsis and other traders in the Sadar Bazar. With the increase in the number of troops rows and groups of residences have been built first at Vanavdi, then at the Neutral Lines, and then at Ghorpadi. From the growing importance of Poona as one of the head-quarters of Government, the demand of civil and military officers for houses and offices has steadily increased and has led to the building of the staff lines to the north of the cantonment in the direction of the railway and the river.

Kirkee Cantonment.

The cantonment of Kirkee on the right bank of the Mutha, about four miles north-west of the Poona Cantonment, includes an area of about 2709 acres. It is bounded roughly on the north and east by the Mula, on the south by a line drawn from the old Government gardens to the top of the ridge on the parade ground, and on the west by a line from the parade ground ridge to the Mula river. It is a flat plain except close to the river where it is scored with water courses. To the north and west much of the land is barren and rocky growing little but grass and a few stunted trees. To the north-east are patches of rich soil watered by a canal from Lake Fife and growing rich crops of sugarcane. Much of the south is closely covered with young *babul* trees. Most of the roads are well shaded. There is only one Europe shop, and the houses are almost all small, with large trees round the enclosures, within which however there are few shrubs or flowers.

Kirkee is the principal Artillery station in the Bombay Presidency and is the head-quarters of the Bombay Sappers and Miners. The garrison of Kirkee includes the Bombay Sappers and Miners, one battery of Royal Horse Artillery, two Field Batteries, one company of European Infantry, and one company of Native Infantry. The presence of the Powder Works (72) and the Small Arms Ammunition Factory (104) give Kirkee a special military importance.

The Kirkee Bazar was established in 1822 by the 4th Light Dragoons who came here from Kaira in Gujarat. Kirkee Cantonment has thirty-three bungalows owned by Parsis and Hindus, and rented by the military officers stationed at Kirkee, and by the subordinates of the Gunpowder and Small Arms Ammunition Factories. In a market place or bazar are 464 houses generally single storeyed, the walls of burnt brick or stone, and the roofs of 432 tiled and of thirty-two thatched. Besides the troops and the European and other mechanics employed in the Small Arms and Gunpowder Factories, the population consists of servants of officers and their families, and grasscutters, butchers, cowkeepers, grainsellers, woodsellers, petty traders, and others usually found in a large regimental bazar. The cantonment has one palm liquor, one country spirit, one opium, and two European liquor shops.

The cantonment has one Muhammadan burying ground, and a Hindu burning and burying ground to the north of the bazar, and two Christian graveyards, one, now closed, at the corner between the main road and the north end of Holkar's Bridge (75), and the other, now in use, to the right of the road from Holkar's Bridge to the Gunpowder Factory.

The income of the Kirkee Cantonment Funds for 1883-84 was, including a balance of £424 (Rs. 4240), £1337 (Rs. 13,370) and the expenditure £1072 (Rs. 10,720). The chief sources of income are a grazing fund, fees, passes, taxes, and licenses, and they chief heads of expenditure are a Lock Hospital and conservancy. The Cantonment is managed by a committee composed of the Commanding Officer at Kirkee as the permanent President, and eight members, the Collector and District Magistrate, the Senior Regimental Officer, the Senior Medical Officer, the Officer Commanding the Sappers and Miners, the Executive Engineer Poona and Kirkee, the Medical Officer in charge Kirkee Lock Hospital, the Cantonment Magistrate Poona and Kirkee, and the Station Staff Officer. The committee meets monthly for the transaction of business. A military officer is secretary to the Kirkee Cantonment committee, and is the executive head of the establishment maintained from Cantonment funds. The Cantonment Magistrate, Poona, has charge of the magisterial work of the cantonment. All criminal cases arising at Kirkee are either sent to Poona for trial or are tried at Kirkee by the Cantonment Magistrate, Poona.

The New Jhansi lines in which are the Sappers and Miners, have lately been built to the south-east of Kirkee. The bazar attached to the new lines is small, including about fourteen houses which are chiefly occupied by the followers and petty dealers attached to the corps. For cantonment purposes the New Jhansi lines are included in the station of Kirkee.

Suburban Municipality.

The Civil Lines or Suburban Municipality, started on 12th February 1884, includes an area of about one and three quarters of a square mile lying to the north-west of the Poona cantonment. This area is divided by the railway into two nearly equal sections. The south-railway section has a length from the railway south to the Synagogue (113) of about 1200

yards, and from about the same breadth in the north, from the west end of the railway station (97) to the Council Hall (52), it gradually narrows to about 300 yards in the south. The north-railway section is a rectangular block about 1200 yards from north to south from the railway to the river, and about 1500 yards from east to west from the Koregaon road to a line running from the east end of the railway station to the river. Most of the north section, especially towards the river, is rich black soil cropped and well wooded. It contains the Bund Gardens (47) in the north and four groups of houses, the four houses or Char Bungalows parallel to and about a hundred yards to the west of the Koregaon road; houses on both sides of the Bund Garden road which crosses the section from its south-west to its north-east corner; and in the west Sir A. Sassoon's bungalows in the extreme north-west of the Civil Lines, that run north from the east end of the railway station. Except in the west, where is rich cropped land, most of the south-railway section is like the cantonment of poor soil and the style of houses and gardens is much the same as in the west parts of the cantonment.

For conservancy purposes the Suburban Municipality is divided into three wards, one, including the parts on the north of the railway line up to the river; the second the part south of the railway line up to the city limits; and the third the parts along Kirkee road from the railway overbridge near the Sangam (99) to the Kirkee Cantonment boundary near the shop of Messrs. Cursetji and Sons.

The suburban municipal limit includes 184 houses, 135 of them bungalows with a total population of 2597 and during the rains of about 3000. The chief residents are European Government officers and some Native gentlemen. Near the railway station are some livery stables, a mixed shopkeeping native population forming the suburban municipal bazar. The lands included within suburban limits are under the management of a committee of sixteen, of Whom, besides the Collector and District Magistrate who is President, five are official and ten are non-official. The income, which is drawn from octroi, house-tax, conservancy-rate, and license fees, amounts to about £800 (Rs. 8000). The monthly charges, estimated at about £26 10s. (Rs. 265), are chiefly under staff and conservancy. At present the chief conservancy duties are sweeping roads, taking rubbish from houses and gardens, and carting away nightsoil.

Within suburban limits are sixteen objects of interest of which details are given later on. These are the Bund Gardens on the river bank about a mile and a quarter to the north of the post-office; the Collector's Office about a quarter of a mile west of the post office; the Boat-house of the Poona Boat Club on the river bank west of the Bund Gardens; the FitzGerald Bridge across the Mula-Mutha at the east end of the Bund Gardens about a mile and a quarter north of the post office; Gar Pir's tomb about 150 yards south of the post office; a graveyard with old European tombs (1819-1822) about 200 yards south of the post office; the Jamsetji Bund across the Mula-Mutha to the north of the Bund Gardens; the Military Accounts Offices about 100 yards west of the post office; the Photozincographic Office about fifty yards west of the post office; the Poona Hotel about 150 yards east of the post office; the Post Office near the centre of the south-railway section; the Railway Station about 650 yards north-west of the post office; the Royal Family Hotel close to the railway station; the Sassoon Hospital about 500 yards west of

the post office; St. Paul's Church about fifty yards south of the post office; and the Synagogue about 500 yards south of the post office. The [From materials chiefly contributed by Colonel W. M. Ducat, R. E. Much help has also been received from Colonel C. D. U. LaTouche and Major Benson's *Compendium* of Information regarding Poona.] following are the accounts, alphabetically arranged, of the chief objects of interest outside the Poona City municipal limits

Objects

Albert Edward Institute(41).

The ALBERT EDWARD INSTITUTE is in East Street Sadar Bazar. The institute, which consists of a reading room and a library with sixty-one members, was built to commemorate the visit of His Royal Highness the Prince of Wales to Poona in November 1875. The building cost about £1500 (Rs. 15,000) and was opened by His Excellency Sir James Fergusson, Bart. Governor of Bombay, on the 12th of September 1880. The institute is open daily from 6 A.M. to 9 P.M. The library contains 1000 volumes.

Arsenal(42).

The ARSENAL, with a notable masonry tower about 1000 yards south-east of the post office, covers an area of about 160 yards by 100 on the high ground to the north of the Club of Western India in the north of the Native Infantry lines. The Arsenal was built in 1822 and various additions have since been made. The charge of the Commissary of Ordnance at Poona has been reduced from an Arsenal to an Ordnance Depot for which some of the old Arsenal buildings are now used. Others of the buildings are used by a branch of the Gun Carriage Factory. The buildings represent a value of £5634 (Rs. 56,340) on the books of the Executive Engineer Poona and Kirkee.

Band Stands(43).

There are two BAND STANDS or places where military bands play. One of these is in the Soldiers Gardens, to the east of the Race Course in cantonment limits, the other is at the Bund Gardens in suburban municipal limits.

Baptist Chapel(44).

The BAPTIST CHAPEL, of brick and mortar, was built in 1858 at a cost of about £2000 (Rs. 20,000) most of which was contributed by General Havelock. The chapel has room for 500 people and morning services are held on Monday, Wednesday, Friday, and Sunday and an evening service on Sunday. It has a baptistry, a vestry, a library, and a school in the city. In the beginning the building was chiefly used for Havelock's men, Highlanders, and other British soldiers. Of late the congregation has become almost entirely native.

Bhamburda(45).

BHAMBURDA village, with about 3120 people, lies on the left bank of the Mutha, 1.83 miles west of the post-office and a quarter of a mile north of Poona city, with which it is joined by the Lakdi bridge and a causeway or *dharan*. A large cattle market is held every Wednesday and Sunday, at which 100 to 150 bullocks, twenty to thirty cows, ten to fifteen buffaloes, fifty to eighty sheep, and as many goats, are usually offered for sale. From *A'shvin* or October -November to *Margshirsh* or December-January the number of cattle is larger, being at the highest thrice the number given above. Large stores of grass, millet stalks, and fuel are kept in the village for the use of Poona city. Within the village limits are several European residences and the old rock-cut temple of Panchaleshvar of which details are given under Panchaleshvar (90). In 1801 Vithoji Holkar was captured in a house in Bhamburda village, and by order of Bajirav Peshwa to please Sindia, was dragged to death at the foot of an elephant through the streets of Poona. It was Yashvantrav Holkar's rage at his brother's murder that led to the flight of Bajirav from Poona and the treaty of Bassein (30th December 1802).[Grant Duffs Marathas, 554.]

Botanical Gardens(46).

The BOTANICAL GARDENS, about half a mile north of Government House Ganeshkhind and 52 miles north-west of the post office, are under the management of a superintendent who is under the control of the Collector of Poona and the Commissioner Central Division. These gardens have now (July 1884) been transferred to the Soldiers' Gardens in the east of the cantonment. Details of their past working are given in the Agricultural chapter. [Part II. pp. 77 - 80.]

Bund Gardens(47).

The BUND GARDENS, on the right bank of the Mula-Mutha river about a mile and a quarter north-east of the railway station, close above the FitzGerald bridge, take their name from the Jamsetji Bund or Dam which there stretches across the river. The gardens measure about 180 yards from east to west by about eighty yards from north to south. They were opened in 1869 when the FitzGerald bridge was finished to which they form the approach from the Poona side. They were designed and made by the late Colonel Sellon, R. E. whose taste and skill turned an unsightly plot of waste into a pleasing and varied garden. The grounds are laid out in terraces to which flights of handsome cut-stone steps lead, the lowest terrace overlooking the river being faced by a massive wall about thirty feet high. In the centre of the garden is an ornamental marble fountain, and, on the west, near the carriage stand, is a bandstand where a military band plays two or three times a week. These gardens are beautifully planted and kept in careful order and are the favourite resort of the people of Poona of all classes.

Chatarshingi Hill (48).

CHATARSHINGI HILL, about three miles north-west of Poona, has a temple of Chatarshingi Devi. According to a local legend Dullabhshet, a rich banker, who in 1786 coined the two-barred copper coins known as *dudandi* or *shivrai*, used to go every year to the temple of Saptashringi about thirty miles north of Nasik. When he grew old, the

goddess took pity on him, and coming to the Chatarshingi hill, told him in a dream that he might worship her at Chatarshingi hill and need not in future go the Saptashringi. The temple stands on the hill slope on a site made partly by cutting into the rock and partly by banking soil with a high retaining wall. The main temple is a small room with an open porch, a vault, and a conical spire, all of stone. Beyond, on a lower level, is the wood and brick hall or *sabhamandap* with a tiled roof. A fair is held at the temple during the nine *navratra* days before *Dasara* in *Ashvin* or September-October to which people come in large numbers from the city and have merry picnics. The ascent is by a rude flight of steep stone steps. The temple enjoys a small allowance from the Parvati temple revenues. Offerings of goats are made to the goddess during the fair days and vows of goats are common throughout the year. A *hom* or sacrifice of clarified butter, cooked rice, and pieces of holy wood is performed on an altar during the *navratra* holidays.

Club of Western India (49).

The CLUB OF WESTERN INDIA, at the north end of Elphinstone street about a mile and a quarter south-east of the railway station, stands in an enclosure about 200 yards long and 150 yards broad. The Club-house is a one-storeyed building, entered from a large porch flanked by a lavatory and the Honorary Secretary's office room. Inside is the drawing room (45' by 18' by 18'). To the left, opening out of the drawing room by wide archways and almost forming part of the room, are two recesses one used as a card room the other as a magazine room. To the right are smaller recesses lined with book shelves. Including these recesses the size of the drawing room section of the club is about forty-five feet square. Beyond the drawing room and occupying the centre of the building is an octagon room seventeen feet each way, devoted to the newspapers of the day and to subscription lists. To the left of the octagon is the writing room. To the right, an open porch or veranda (45' by 30') used as a reading and smoking room, projects into the garden. Beyond the octagon, and flanked north and south by verandas, is the coffee room or dining room (60' by 30' by 24'). Beyond the coffee room, and connecting the main building with the billiard room, is a roofed gallery (54' by 36') in which the members of the club dine in the hot weather. The billiard room (50' by 25' by 15') completes the main range of the club buildings. To the north of this range are the club chambers, built in 1866, a one-storeyed block of five sets of rooms which are let unfurnished and cannot be engaged for a shorter period than one month. North of the club chambers is a two-storeyed block built in 1875 and containing eight sets of apartments known as the new bed rooms.

These are furnished and cannot be engaged for more than fourteen days in the season (1st June-31st October) or a month at other times of the year. Behind the club is the original range of bed rooms built in 1866 and now known as the old bed rooms. This range contains seven sets of rooms which are let on similar terms to the new bed rooms. Behind the chambers, and close to the eastern boundary of the club enclosure, is a covered racket court built of stone in 1868. Behind the line of main buildings, chambers, and new bedrooms, the north and south ends of the club enclosure are occupied by servants' quarters, stables, and other outhouses. The club buildings were formerly in two enclosures and were bought from their former owners when the club was started in 1866.

The bungalow, which formed the nucleus of the club-house, was owned by Mr. Padamji Pestanji and was last occupied by Colonel D'Oyly Compton. It was long known as the Sholapur or Sholapur thatch bungalow, tradition says because it used to be thatched in a fashion common at Sholapur but uncommon at Poona. The enclosure in which the chambers and new bedrooms stand was the property of Nandram Naik a wealthy contractor and house proprietor. At present (July 1884) large additions are being made to the club-house and grounds.

Collector's Office(50).

The COLLECTOR'S OFFICE, in suburban municipal limits about 700 yards south of the railway station and about 400 yards west of the post office, includes several detached buildings in one enclosure. These buildings are divided into seven parts, the Collector's office, the treasury, the bookbinders' shed, the Registrar's office, the treasury record room, the stamp paper room, and the treasury guard room. All are old buildings to which additions have been made from time to time. A witness shed and record room were added in 1881 at a cost of £648 (Rs. 6480). Designs have been prepared by Colonel, now General, St. Clair Wilkins, R. E. for a Collector's office agreeing in style with its near neighbour the Sassoon Hospital.

Convent(51).

The POONA CONVENT, near the centre of the Sadar Bazar about 550 yards west of the Club of Western India, is set apart for the education of the orphan children of British soldiers. A day school for girls and a free school for the poor complete the establishment which is managed by the Religious Ladies of Jesus and Mary. The convent is a pretty little cutstone building in grave Gothic style with a roof of Mangalore tiles. It was built in 1865 from public subscriptions, Government doubling the amount subscribed. The entire cost, including a home for destitute women added in 1872, was £8000 (Rs. 80,000).

Council Hall.(52).

The COUNCIL HALL, a large two-storeyed building with central tower, is on the west border of cantonment limits about half a mile south-east of the railway station and about 700 yards north-east of the post office. It was originally bought by Government for £5087 10s. (Rs. 50,875), and has been almost entirely rebuilt and greatly enlarged. It is a double-storeyed building nearly rectangular in plan, 183' by 53' and 40' to the top of the walls. It is in the Venetian-Gothic style of ornamental coloured brickwork. The porch in the middle of the west face is surmounted by a tower or campanile 76' high with low-pitched tiled roof. The original building, which was bought by Government as a Council Hall, is so small a part of the present hall that the present building may be looked on as new. On the ground floor at the north end and stretching above the first floor to the roof is the Council Hall, 80' by 40' and 40' high. It is surrounded on three sides by a gallery six feet wide supported on light iron cantilevers. The Council Hall is painted white picked out with gold and the planked ceiling is treated in the same way. At the south end are two rooms, each 30' by 20' with an archway between and enclosed on the outside by a cloister

12' wide. These are used as a picture gallery and contain numerous portraits chiefly of Indian Princes and Chiefs. Opposite the centre is an entrance hall 17' by 17' beyond which is the staircase. On the first floor, over the picture rooms, are two similar rooms, one used by the Governor and the other by his Private Secretary. These, like the rooms below them, are surrounded by cloisters with open stone mullioned windows. The hall was designed and built by Major, now Colonel, Melliss then Executive Engineer, Poona, and was completed in 1870 at a cost of £12,294 (Rs. 1,22,940) including some small outhouses, and exclusive of the cost of the old building.

Deccan College (53).

The DECCAN COLLEGE stands on rising ground about half a mile back from the left bank of the Mutha river, 2.93 miles north of the post office and about five miles north-east of Poona between Poona and Kirkee cantonment. It was completed in 1868 at a cost of £24,596 6s. (Rs. 2,45,963) of which £12,500 (Rs. 1,25,000) were contributed by Sir Jamsetji Jijibhai Bart. It is in the Gothic style of architecture, designed by Captain, now General, St. Clair Wilkins, R. E., and built of gray trap with high-pitched red iron roof. It is a double storeyed building, two wings (each 154' by 26') forming with the main building (242' by 524') three sides of a quadrangle to which there is a vaulted, carriage entrance beneath the tower close to the north-west angle. All three of the inner faces are arcaded on both storeys, the arcades being 10½' wide. At the north-west corner of the main block is a masonry tower 106 feet to the top of its high pitched roof. The whole of both wings are occupied by quarters for the students, including thirty-one rooms below (each 10' by 6') and twenty rooms above (each 21' by 104'). The main building contains in its lower storey two class rooms 20' by 20', two 24½' by 16½', and a laboratory 24½' by 34'. In the upper storey are the large College Hall (70 by 25' and 24' high) used as a library as well as on public occasions, and four other class rooms two of 20½' by 20½' and two of 21¾' by 20½' besides the Principal's room (16½' by 16½') under the tower. The out-buildings include a block of eight rooms with a cook-house for Hindu students; a block of three sets of two rooms each with cook-room for Dakshina Fellows [Details of the Dakshina fund are given above under Instruction, pp. 48,62-64.]; and a Parsi cook-house and wash-house.

European East Street Graveyard (54).

East Street has an OLD EUROPEAN CEMETERY, in the form of a trapezoid, with an area of 1.54 acres. It is situated between the Main street of the sadar Bazar and East Street, the houses in the former standing close to the compound wall. The cemetery contains 231 masonry monuments and headstones, many of which are in good condition, but several are falling to decay. The dates on the inscriptions range from 1823 to 1846. Two tombs bear the date 1855 and one 1856. A Government gardener under the orders of the Chaplain of St. Paul's church looks after this cemetery and the one near St. Paul's church; and the compound enclosure is kept in good condition by the Public Works Department.

European Garpir Graveyard (55).

About 200 yards to the south of the Collector's office, and close to the north of the Musalman Garpir graveyard, in a small enclosure surrounded with a brick wall and containing two old tamarind trees and some young *nims* and Mellingtonias, is an old EUROPEAN BURYING GROUND with seventeen tombs. One is a beautifully built cut-stone canopy supported by pillars on a cut-stone plinth. The rest, some of stone and others of cement-covered brick, are plain tombs about eight feet long by three wide and three or four high. The large canopy tomb has no date or inscription. It is said to mark the grave of a French officer in the Peshwa's service. But as the last Peshwa had no French officers this tradition is apparently inaccurate. [According to another account (Chesson and Woodhall's Miscellany, VII. 59) the tomb is of a lady named Mrs. Virges, whose husband, who was Deputy Paymaster of the Poona Pi vision, went to Calcutta to bring her statue but never returned nor sent the statue.] The inscriptions on the other tombs vary in date from 1819 to 1822.[One to Captain John Lewis of the Poona Auxiliary Horse is dated 10th August 1819, another to Captain Samuel Halifax, Bombay European Regiment and Deputy Adjutant General, is dated 26th January 1820.]

European Ghorpadi Barracks Graveyard (56).

The EUROPEAN GRAVEYARD at Ghorpadi lies about 300 yards beyond the north-east boundary line of the Cantonment, and is intended for the interment of troops dying while quartered in the Ghorpadi Barracks. It is a square piece of ground, with an area of 1.86 acres, surrounded by a masonry enclosure wall; one-half of the cemetery is allotted for the Church of England community, and the other half is allotted between Roman Catholics and Nonconformists. There are 233 graves in the Church of England portion, 189 in the Roman Catholic portion, and twenty in the Nonconformists portion, or 442 in all. The earliest date on any of the tombs is 1864. The cemetery is well planted with trees and shrubs, and is looked after by the authorised, establishment.

European Sangam Graveyard (57).

On the right bank of the Mula from 300 to 400 yards west of 'The Sangam' is an oblong enclosure twenty-four yards long by twenty-one wide. The enclosure contains twenty-one tombs one of them high and surmounted by a monumental urn. Except one tomb, inscriptions have disappeared from all and cavities remain to mark which of them contained inscription stones. The tomb with the inscription has a cavity for an inscription stone at the other end of the grave, which shows that more than one person is buried in the same grave. The inscription' Sacred to the memory of Mrs. Caroline Lodwick who departed this life January 29th 1819, leaving a husband and three daughters to deplore their irreparable loss. [Mr. T. M. Filgate.]

European Kirkee Battle Graveyard(58).

This cemetery is also known as the "BATTLE of KIRKEE GRAVEYARD" where the bodies of some of the slain in that battle were buried. It was originally the Residency cemetery, the old Residency standing where the Judge's house now stands. [Mr. T. M. Filgate.]

European Satara Road Graveyard(59).

The EUROPEAN SATARA ROAD GRAVEYARD lies on the south-west boundary of the cantonment near the Lal-bag, 205 miles from the Poona post office. It is an irregularly shaped piece of ground with an area of 5.07 acres, and is surrounded by a masonry compound wall. The cemetery is divided into three portions, one for the Church of England with an area of 3.09 acres, one for the Church of Scotland with an area of 0.74 acre, and one for Roman Catholics with an area of 1.24 acres. A masonry wall divides the Church of England from other portions; and the Roman Catholic and Church of Scotland portions are divided from each other by a range of boundary stones. There are about 2000 graves in the cemetery, of which 1265 are in the Church of England portion, 505 in the Roman Catholic portion, and 250 in the Church of Scotland portion. The dates on the tombs range from 1845 to 1883. There are many well grown trees in the cemetery and numerous plants and shrubs, which are taken care of by the Government gardener under the Chaplain of Poona. The cemetery is very thickly filled with graves in several parts and has been closed. [Benson's Compendium, 43.]

European Sholapur Road Graveyard (60).

The NEW POONA CEMETERY lies about a quarter of a mile beyond the Cantonment eastern limits on the Sholapur road and 3.07 miles from the Poona post office. The enclosure wall, out-buildings and approach were finished in 1882, and £900 (Rs. 9000) have been spent in the planting of trees, construction of roads and paths, and in improving the water-supply of the cemetery, which is from three draw-wells, each provided with a Persian wheel for raising water. The cemetery has only one entrance gateway, which is surmounted by a neatly moulded Gothic arch, gabled and coped with cut-stone. A cleanly cut and appropriately designed cut-stone cross rests on the apex of the gable, and adds much to the appearance of the entrance. The out-buildings, consisting of two burial sheds, two chaplain's rooms, and watchmen's quarters, are of coursed rubble masonry, with a Mangalore tiled roof constructed in Gothic pitch, gabled at either end in front of the two burial sheds, and finished with ornamental eaves and large boards. The total area of the cemetery is 12.82 acres, which will afford space for 5291 graves. One-half of the cemetery is allotted for the Church of England community and the other half divided between the Roman Catholics and Presbyterians, allowing the former double the space allotted to the latter. The portions for the different denominations are merely separated from each other by paths. [Benson's Compendium, 44.]

European St.Paul's Church Graveyard (61).

ST. PAUL'S CHURCH GRAVEYARD near St. Paul's church, is an old European graveyard, a rectangular plot of ground with an area of 9890 superficial feet, surrounded by a good masonry wall with a neat iron gate. The cemetery is kept very clean; but only seventeen graves are at present visible, and these are marked by masonry tombs, on four of which only inscriptions now remain, and these bear the dates 1819, 1820, 1821 and 1822.[Benson's Compendium, 43.]

Fire Temples (62).

Poona has two FIRE TEMPLES. One of these in the north of Nana ward in the west of the city, was finished on the 6th of August 1824 by Mr. Sorabji Ratanji Patel a Sardar of the Deccan and was rebuilt in 1877 by Khan Bahadur Dastur Nasarvanji Jamaspji. The second fire temple is in the Camp close to the office of the Poona Observer paper. It was finished on the 29th of November 1844 by Sir Jamsetji Jijibhai. To the east of the temple, in the centre of a three-cornered plot, is a fountain called the Jamsetji Fountain.

FitzGerald Bridge (63).

The FITZGERALD BRIDGE, better known as the Bund bridge from its position on the Mula-Mutha river, close below the Jamsetji Bund or Dam, is a handsome as well as a substantial structure carrying the Poona and Ahmadnagar road across the river. It consists of thirteen elliptical arches each of 60' span with a rise of 15½ and an arching 2' 9" thick. The roadway, which is 28' wide including a 6' side walk, is carried at a height of 48 above the deepest part of the river bed, and is enclosed by handsome open work cutstone parapets 4' high. The bridge was designed and built by Captain R. S. Sellon, R. E. Executive Engineer Poona District, and completed in 1867 at a cost of £24,180 (Rs. 2,41,800).

Free church Mission Church (64).

The FREE CHURCH MISSION CHURCH is a plain stone and brick building in early English style built about 1870 at a cost of £1500 (Rs. 15,000). The church has room for a congregation of 180 Europeans Eurasians and Natives. The church has an organ and holds services twice a week. There are sixty communicants and sixty adherents and a Sunday school attached.

French Tombs (65).

To the east of the Ghorpadi Lines, in a grove of *babhul* trees, on the left bank of Bahiroba's stream, is a small enclosure with one large and several small Christian tombs. Some have inscriptions which the weather and the rain-drip from the trees have made unreadable. The only name that can be read is that of Madame Dud(f?)rencque, perhaps the wife of the DudFrenec whom Grant Duff mentions as a general in Tukoji Holkar's army in 1794.[Marathas, 498, 501.] The other tombs are believed to belong to French officers, probably of Sindia's and Holkar's armies, who died in Poona towards the close of the last century. A tablet in the graveyard bears these words, ' Madame DuFrencque. Officers and others buried here up to A.D. 1817. Put in order 1876.'

French Tombs (66).

On the south of the road from Poona Cantonment to Parvati's temple, close to the west of Shankarseth's bridge, 2.53 miles from the Poona post office, stand four tombs supposed to be of French officers in Sindia's or Holkar's service in the latter part of the eighteenth

century. On one of the tombs is an upright cross backed by a stone slab. In the niches formed by the arms of the cross with the slab, lamps are placed by the neighbouring cultivators and by the R.C. priests of Panch Haud. At the foot of another tomb, consisting of a mass of stone about eight feet long and two feet high, some Hindus make offerings to Mari the cholera goddess, in whose honour the blood of a goat is poured on the ground before the tomb and small red stones are propped up against its sides. Of the two other tombs only one remains, an obelisk about fifteen feet high. On its pedestal is an inscription of which only the word *memor* can be read.

GaneshKhind Caves (67).

On the Bombay road, from near the south entrance to Government House, Ganesh khind, where there is a modern temple to Chatarshingi Devi, 4.08 miles from the Poona post office, the Bhamburda hills bend to the west and come back in a horseshoe curve to about the same position as the Chatarshingi Hill. At this point, about forty feet from the foot of the hill, approached by a rough path, is a small rock temple about 20' by 15' and 10' high. It was formerly bare and empty, but an ascetic or *Bava* has lately taken up his quarters in the cave and made a *ling* in the centre and rudely cut images of Vithoba and Lakshmi in the back wall. The Bava lives in a small corner of the cave which he has walled off. About forty yards to the west, and twenty feet up the hill side, are two cells and about forty yards further and a little lower is a dry water cistern. A fair is held every Friday at Chatarshingi, and on that day and on the last of the *Navratra* days in September-October people come to the temple of the Devi and go from it to the cave and breakfast there. The Chief of Jath is said to have consulted this Bava as to his chance of regaining the management of his estates, and has been at the expense of digging a large step-well which is still unfinished and of building a wall to strengthen the platform in front of the cave door.

Garpir Graveyard (68).

GARPIR, or the Quartz Saint Graveyard, is a Musalman graveyard about 150 yards south-east of the Collector's office and 250 yards west of St. Paul's church. It is across the road from the small Garpir European graveyard (55). In the Musalman Garpir graveyard, which is a large plot of ground with several old tamarind trees, are a few poor houses belonging to the guardians or *mujavars* of the tomb and many graves. It is entered by a poor gateway in the west wall. Passing south on the right is a large masonry well with flights of stone steps said to have been built by a Rani of Satara. A few paces to the south in the open air, surrounded by an open ruined trellis work, is the grave of the Quartz Saint, who, according to the ministrant, was one of the first Musalmans to settle in Poona and lived at the time (1290) of the two Shaikh Sallas. The saint's grave is a rough low cairn of the handsome blue white and pink quartz crystals which are found in the Sahyadris. When the saint died he left orders that no masonry tomb should be built over him; he was to lie in the open air under a pile of loose quartz stones. The Hindu worship of quartz, perhaps because it is a fire-holder, suggests that this place of worship is older than the Musalmans. [The object of worship in one of the Pandharpur temples is a quartz *ling* or Garicha Mahadev. Powdered quartz called *rangoli* is also sprinkled on door-steps

and round dining places as lucky'or spirit-scaring. Details of the use of this quartz are given in the Dharwar Statistical Account, 821-822. With the quartz *ling* and the lucky quartz powder compare the conical masses of white quartz found in burial mounds in Inverary and Dundee in Scotland and in Letcombe Castle and Maiden Castle in England and the white quartz stones found in graves in the Hebrids and the Isle of Cambrae (Miss Gordon cumming, in the Hebrids, 45-46). The objects of putting white and fire-Yielding, and therefore spirit-scaring stones in the graves seems originally to have been to overawe the ghost of the dreaded dead, and, at a latter stage, to the scareevial spirits from the bones of the beloved dead.] The head-stone which peeps out from the crystals is also curiously like a *ling*. The crowded graves in the ground near show how highly the saint is respected. A few paces to the south is a small poor mosque. About eighty yards to the east of the mosque is a flat stone tomb with a loose headpiece. On the flat stone the following inscription is carved:

In memory of Allah Baksh valad Aisan Oomeranu Beeluch, for many years the faithful friend and servant of Sir Bartle Frere, K.C.B. Governor of Bombay. He died 20th July 1865 and was buried here. May God be merciful to him.

Formerly Garpir was important enough to give his name to the whole tract in the neighbourhood of St. Paul's church. In 1803 General Wellesley chose Garpir as the cantonment of the British force which was left to guard Poona, and this continued the cantonment till the final breach with Bajirav Peshwa in 1817. It was then found that the hedges and enclosures that ran close to the lines offered easy concealment either for the Peshwa's emissaries who wished to corrupt the British troops or for such of the troops as were inclined to desert. The bulk of the force was accordingly moved to Kirkee, a few days before the battle of Kirkee (5th November 1817). In the afternoon of the 5th of November, before the Peshwa's troops began to move from Poona, the rest of the troops were withdrawn to the Sangam and from the Sangam to Kirkee. [Details are giren below under Kirkee Battle-field, pp. 376 - 377.]

Ghashiram's Mansion (60).

To the west of the reservoir that lies to the west of St. Mary's church is a two-storeyed building of cut-stone with ornamental stone arches and pillars, and, in the west wall, an overhanging stone window with pillars and canopy. It was the gateway of the mansion of Ghashiram Kotval (1742-1791). All traces of the house have been removed and the yard is used as a commissariat store.

Ghashiram was a Kanoj Brahman of Aurangabad who rose to be the head of the Poona police by giving his daughter to be the mistress of Nana Fadnavis. Ghashiram used his power with great cruelty and injustice. On one occasion (30th August 1791) he confined a number of Telang Brahmans in a cell so small and so unwholesome that during the night twenty-one of the prisoners died of suffocation. Next morning, when news of these murders got abroad, the city rose and threatened to destroy the Peshwa's palace unless Ghashiram was executed. To quiet the mob the Peshwa gave up Ghashiram who was

stoned to death by the castefellows of the murdered men. [Moor's Hindu Pantheon, 372-373. Details are given below in the History of Poona city.]

Ghorpadi Barracks (70).

The GHORPADI BARRACKS form the front or westmost part of the Ghorpadi lines in the north-east section of cantonment limits. They consist of a number of single storeyed buildings with room for 652 rank and file besides Serjeants. Three sets of barracks have been built at different dates. The oldest, completed in 1842, includes twelve separate buildings, each containing a barrack room (97' x 24' X 12') to hold twenty-two men with a Serjeant's quarters at the end consisting of two rooms each 114'x 114'. The whole is surrounded by a veranda eight feet wide, open but protected from rain by weather-boards. About the same date (1842) were built the Patcherries or married men's quarters in four blocks of twenty quarters each. In 1849 a second set of twelve blocks was added. Each block contained a barrack room (113' X 24' x 18') to hold twenty-six men with a Serjeant's quarters (114' X 24'). Surrounding the whole was a veranda, 12' 6" broad, enclosed on the west from the monsoon by a dwarf wall surmounted by Venetians and glazed windows. The latest set of barracks, which was completed in 1880, consists of six blocks each containing a barrack room (166'x 25'x 20') with a Serjeant's quarters consisting of two rooms and a bath room, with a separate entrance, at the end. The whole is surrounded by a veranda 12' 6" broad enclosed on the west by strong Venetians. The last barracks with their outhouses are built after the latest sanitary rules. The plinths are high, the floors are of cut-stone paving, and ventilation is secured by an opening along the ridge covered inside by wire gauze and protected outside by an iron shield. The barracks have clerestory windows and the fanlights over the doors revolve. The space allowed for each man is 2400 cubic feet and 120 square feet of floor space. With their lofty open teak-planked roof and numerous glazed doors these barrack rooms look very spacious and airy. The lavatories and latrines are in detached buildings and have all the latest sanitary fittings. The barracks include all the buildings for work and recreation mentioned in the description of the Vanavdi Barracks and a chapel in addition. [See below Vanavdi Barracks (116).] The whole barracks have been built by successive Executive Engineers of Poona at a total cost of £68,378 (Rs. 6,83,780).

Government House(71).

GOVERNMENT HOUSE, GANESHKHIND from June till October the residence of His Excellency the Governor of Bombay, stands 4.36 miles north-west of Poona post office on rising land in the centre of a bleak rocky plain broken towards the south by low bare hills. The grounds round the house are well clothed with trees and shrubs. The House is in the centre of 512 acres of waving land, which have been laid out in roads and planted with trees to form ornamental grounds, and to give sites for the subsidiary buildings and houses for the staff. It was begun in 1864 during the governorship of Sir Bartle Frere and was finished in 1871. The main building is in the Italian-Gothic style of the local gray trap rock and was built by Mr. Howard C. E. from designs by Mr. Trubshawe. Its length of 300 feet run-ning north and south is broken into two double-storeyed wings connected by a lower central portion. The northern and larger wing carries a tower 100 feet high.

The south wing and centre contain on their ground floors the public rooms consisting of a Darbar or drawing room (80' by 30'), a large dining room (60' by 30') with arches on both sides, the back arcade opening into a large conservatory handsomely decorated in white and gold. On the upper storey are bed rooms. The north wing contains the Governor's office and rooms forming his private residence. Besides the outbuildings in more immediate connection with the house (which comprise a fine range of stables and coach-houses) the grounds contain four staff bungalows, a guard room with ornamental clock-tower, and very complete European barracks for the Governor's band. About a mile to the west are lines for His Excellency's Native Cavalry Bodyguard, consisting of seventy sabres. The cost of the main building was £106,227 (Rs. 10,62,270) and of the whole in round numbers £160,000 (Rs. 16 lakhs).

Gunpowder Factory (72).

The [Contributed by Lieut.-Colonel Wake, R. A.] GUNPOWDER FACTORY lies 4.88 miles north-west of Poona post *Gunpowder* office and about 1½ miles north of Kirkee. The factory occupies a space of about 100 acres and, in order to guard against complete destruction from an explosion, the buildings used for the manufacture and storage of gunpowder are isolated. For the same reason about 500 acres of land round the factory are kept private.

Buildings.

The factory buildings include a number of store-rooms to hold the ingredients from which gunpowder is made and stores for working the engines and other machinery; a large repairs workshop worked by an eight horsepower engine; a building with machinery for making gunpowder barrels worked by a twenty-five horsepower engine; a number of houses for the various processes of powder-making, and, attached to them, engine and boiler houses with five engines two of twenty-five horsepower, one of twelve horsepower, one of eight horsepower, and one of six horsepower; a saltpetre refinery; a sulphur refinery; and a charcoal-burning house. Outside the factory near the Mula river is a twenty-five horsepower engine for pumping water into the factory in case of a failure of the regular water-supply and quarters for Europeans and Natives. The regular water-supply is brought by pipes from the Pashan reservoir near Ganeshkhind. The water is stored in large reservoirs for the various engines. Stand-pipes are scattered about whence a strong head of water may be drawn in case of fire.

Powder Verieties.

Five varieties of powder are made for Government Pebble powder for heavy guns, R. D. G. 3-powder for medium guns, It. L. G. 2-powder for field guns, R. L. G. 2-powder for Martini-Henry rifles, and R. F. G. powder for Snider rifles. Powders for pistols and mealed powder for laboratory purposes are also made. The monthly outturn of the powders, which depend on the length of time they are incorporated, are pebble, R. L. G. 3, and R. L. G. 2 together about 45,000 lbs., R. F. G.-2 15,000 lbs., and R. F. G. 25,000 lbs. [These powder outturns give, for £1560 (Rs. 15,600) the total monthly cost of the

factory, a rate of about 9*d.* (6 *as.*) a pound for the first three varieties of pebble, R. L. G. 3 and R. L. G. 2., of 2*s.* 2½ *d.* (Re. 1-1-8) a pound for R. F. G. 2, and of 1*s.* 4*d.* (10²/3 *as.*) a pound for R. F, G.] Each variety is made for a special purpose and has certain peculiarities. In regulating the peculiarities, the chief object aimed at is to obtain a powder which shall drive a projectile with the greatest rapidity without straining the cannon or small arm for which the powder is, intended.

Ingredients.

Gunpowder is made of three ingredients, saltpetre sulphur and charcoal, in the proportion of seventy-five parts of saltpetre, ten parts. of sulphur, and fifteen parts of charcoal. Saltpetre called grough in its crude state, is brought by contract from Cawnpur in Upper India. Before it is used saltpetre is refined to get rid of impurities which would affect the keeping qualities of the powder, and especially to ensure freedom from particles of stone or grit which would be an element of danger in the process of powder-making. Sulphur in its crude state is bought by contract and comes chiefly from Sicily. To get rid of stone and grit, before use, sulphur is refined by distillation. Charcoal is obtained by burning the stalks of the *Cajanus indicus* or *tur* plant. The wood is brought ready peeled from contractors who get it from the *tur* fields of the Konkan and Gujarat [Other woods have been tried at the factory but for small arms powder none produce such good charcoal as *tur* wood. *Sevri* or *Jointi*, *Bombax malabaricum*, wood which is much grown about Poona in gardens and sugarcane fields, is likely to be useful in making common powders.]

The monthly establishment charges of the factory amount to £540 (Rs. 5400). The daily hours of work are 6-30 A.M. to 2-30 P.M. and two hours more for the incorporating mills.

Gymkhana(73).

The present Poona GYMKHANA or sport club was formed in 1879 by the union of the Badminton, Lawn Tennis, Croquet, Polo, and Golf clubs with the old Gymkhana which had provided for cricket pigeon-shooting sky-races and sports. The union of these clubs was agreed to at a meeting held in 1879 under the presidency of Sir Richard Temple, then Governor. The managing body of the Gymkhana includes a President and nine members, the secretaries for Cricket, Tennis, Badminton, Pigeon-shooting, Golf, Polo, and Sky Races, a General Secretary and Treasurer, and two other members. The badminton and lawn tennis courts are in the open space to the south of the Council Hall. The tennis courts occupy the site of the old croquet grounds the last of which was turned into a lawn tennis court in 1881. The courts, of which there are seven, are formed of a layer of *murum* or crumbled trap over a layer of road metal the whole carefully levelled and kept in order by constant rolling and watering. The badminton courts are in a thatched building near the southern or Lothian Road end of the same open space. Till 1881 the building was in the form of a cross of four equal limbs lying north, south, east, and west, each limb forming a badminton court and leaving a square space in the centre for on lookers. In 1881 a new court was formed by lengthening the northern limb, and the western limb was turned into dressing rooms. Cricket is played on the open ground to the east of the

Ordnance Lines. The cricket ground is a rectangular space of about 200 yards by 150 enclosed by posts and chains. At the middle of the west side is the pavilion including a central room with dressing rooms at the south end and the buffet, store room, and cook-room at the north end. The Gymkhana race course, of which the winning post was in front of the pavilion, has fallen into disuse and Gymkhana races are now run on the regular Race Course (95). Pigeon-shooting is carried on in the open ground behind the Ordnance Lines about 300 yards north of the cricket pavilion. Polo is played on the ground bounded by the Rest Camp, the old Sapper's Lines, on the Koregaon road, and the Staunton road. The Golf course is partly over the Polo ground and partly on the ground to the east stretching to the Ghorpadi Barracks.

Objects. Gymnasium(74).

The GYMNASIUM, which is one of the finest in the Bombay Presidency, is between St. Andrew's church and the Soldiers' Institute about 450 yards east of St. Mary's church. It was built by Government in 1872 and was opened early in 1873. The building is eighty feet long by fifty-two wide and has two wings (50' by 30') one for a school of arms and the other a recruits' gymnastic drill room. It has also dressing rooms for officers and men and an office. The institution is solely for the use of soldiers and military officers. The staff includes, besides the Inspector of Gymnasiums in the Bombay Presidency, one serjeant-major as chief instructor, and two assistant instructors. All officers, non-commissioned officers, and men sent for instruction to the Poona Central Gymnasium have to pass a gymnastic course. The ordinary course lasts three months and a special gymnastic instructor's course lasts eight months. The chief appliances in the gymnasium are a horizontal bar, parallel bars, vaulting horse, vaulting bar, bridge ladder, rope ladder, inclined ladder, ladder plank, trapezium, shelf, octagon, prepared wall, mast, jumping stand, row of rings, pairs of rings, slanting poles, vertical poles, climbing ropes, vertical ropes and poles, horizontal beams, turning pole, elastic ladder, and dumb and bar bells. Every year about four officers and 700 non-commissioned officers and men are taught gymnastics, and ten officers and twenty non-commissioned officers and men are taught fencing. The voluntary yearly attendance averages thirty officers and 11,594 non-commissioned officers and men. Men attending the gymnasium are taught to swim in a swimming bath attached to the gymnasium.

Holkar's Bridge(75).

HOLKAR'S BRIDGE, 498 feet long by 16' 3" broad, spans the Mutha between Poona and Kirkee east of the Deccan College, 3.54 miles from the Poona post office. The bridge is carried by nineteen arches varying in span from 12' 8' to 22' 5'. The height of the roadway above the river bed is thirty-three feet. The side protections of the bridge are modern and consist of teak railings carried on corbets against the face of the spandrels of the arches to leave the full width of the bridge roadway clear for traffic. [Colonel Ducat, R. E.]

Holkar's Temple (76).

About sixty yards south-west of the south end of Holkar's Bridge, and 3.45 miles from the Poona post office, in an oblong enclosure (90' by 70'), is a temple raised to Vithoji Holkar and his wife who committed *sati* in his honour. It is now called the temple of Mahadev. It is an oblong courtyard enclosed by a nine feet wall with a shrine (15' by 15' by 10') at the south-west end of the courtyard. The shrine has the usual anteroom with side niches and a recess containing two *lings* surmounted by a cupola about nine feet high. In front of the shrine is a low stone platform with a small stone bull or Nandi and a slab carved with footprints. Other objects in the courtyard are a small basil stand, an *Egle marmelos* or *bel* tree, and in a corner the pedestals of the two *lings* which are in the shrine and originally stood on the Nandi platform. The temple was built by one of the Holkars, and is maintained by the present Holkar.

Jamsetji Bund (77).

The JAMSETJI BUND is a masonry dam across the Mula-Mutha about one and a half miles north of the post-office. Its length is 853 feet and the width of its paved top 16½ feet. The lower side is vertical with a greatest height of 17 feet above the rocky bed of the river. In the centre of the dam are four sluices, consisting of arched openings in the masonry 6¼' by 7½' with semicircular tops, closed by planked doors sliding vertically in grooves cut in the masonry. On the upstream side, except in front of the sluices, a paved slope, at one in twelve, stretches from the crest of the dam to the river bed. The object of this gentle slope appears to have been to prevent the lodgment of silt above the dam, an object more effectually gained by the use of sluice gates. The dam formed part of a system of works for supplying the cantonment with water, which was drawn from above the dam through a tower inlet and filter beds, whence it was pumped, originally by bullocks, and afterwards by steam, through iron pipes leading to the cantonment. These have now been superseded by the Khadakvasla water works. These water Works and the dam were completed in 1850 by Captain Studdert, R. E. at a cost of £25,750 (Rs. 2,57,500) of which £17,305 (Rs. 1,73,050) were contributed by Sir Jamsetji Jijibhai. Bart, after whom, the dam was named.

Jews' Graveyard (78).

Within suburban municipal limits, on the right bank of a small stream that runs north, about five hundred yards east of the Koregaon railway crossing, is a rectangular walled enclosure. A wall divides it inside into two unequal parts, the western half belonging to the Konkan Jews or Bene-Israelis, and the eastern half to other Jews.

Near the Native Infantry Lines are some old tombs of Bene-Israel Jew soldiers and Native officers. The site has been long unused.

Kirkee Barracks (79).

The KIRKEE BARRACKS, 3.86 miles from the Poona post office, have been built at various times. The present main barracks are seven handsome 'stone-built two-storeyed buildings, each with room for forty-six men. These barracks, with their cook-rooms

wash-rooms and out-houses, were built in 1870-71 at a cost of £114,353 (Rs. 11,43,530). In addition to these seven main barracks, three old single-storeyed barracks are used as a gymnasium, coffee shop, and reading and prayer rooms. A canteen was built in 1827 and a library in 1866-67. A hospital was built in 1830, containing six wards with beds for seventy-six male patients and a hospital for fourteen female patients. The Royal Artillery Riding School (154'x54') was built in 1849. These barracks have tile-roofed gun-sheds for three batteries, and stabling built between 1864 and 1871. The gun-sheds and stabling consist of two iron-roofed stables, each housing thirty-four horses, built in 1864-65; two iron roofed stables, each housing fifty horses, built in 1866-67; and four iron roofed stables, each housing sixty horses, built in 1870-71.

Kirkee Battle Field (80).

KIRKEE [This account is chiefly compiled from Grant Duff's Marathas, 634-635, 654; Pendhari and Maratha War Papers, 119-128; and Blacker's Maratba War Memoir 64 - 69. Since the account was written, Mr. Elphinstone's description of the battle with a map has been published in Sir T. E. Colebrooke's Life, I, 382-386.] PLAIN is famous for the defeat of the army of the last Peshwa Bajirav (1796 -1817) by a small body of British troops on the 5th of November 1817.

For more than a year the relations between the British Government and the Peshwa had been strained. In July 1816, the murder of Gangadhar Shastri, the Gaikwar's agent, when under British special protection, the favour shown by the Peshwa to Trimbakji Denglia, Gangadhar's murderer, the Peshwa's failure, in spite of ample means, to provide his contingent of troops, and his intrigues with Sindia, Holkar, the Raja of Nagpur, and the Pendharies, determined the Marquis of Hastings, then Governor General, to make such an agreement with the Peshwa as would prevent him from defeating the object of the treaty of Bassein (Dec. 31, 1802). In April 1817, before concluding any agreement, the Governor General insisted that the Peshwa should promise to give up Trimbakji Denglia. For weeks the Peshwa evaded the Resident's demand, till, on the 8th of May, Poona was surrounded by British troops. Then, under the influence of Moro Dikshit, one of his Brahman advisers, who strongly opposed a breach with the English, the Peshwa issued a proclamation offering a reward for the capture of Trimbakji Denglia, and, as a security for his good faith, handed to the British the hill-forts of Purandhar, Sinhgad, and Raygad. The new treaty was then considered, and, in June, after long discussion, the Peshwa agreed to the terms which had been drawn up by Mr. Elphinstone according to the Governor General's instructions. Under this treaty the Peshwa admitted that Trimbakji was Gangadhar's murderer, and promised to show him no favour and to do his best to have him seized and handed to the British. He engaged to have no dealings with any court except through the British Resident, and, instead of the contingent of troops which he had always failed to furnish, he undertook to make over to the British, lands yielding revenue enough to support a force of 5000 cavalry 3000 infantry and a due proportion of ordnance. This treaty, which is known as the treaty of Poona, was concluded on the 13th of June 1817, In accordance with the treaty, after a slight delay, the Peshwa's share of Gujarat, the North Konkan, the fort of Ahmadnagar, and the territories of Dharwar and Kushgal, were made over to the British, the strength of the Peshwa's cavalry was reduced,

and, except a battalion about 500 strong kept in the Peshwa's pay, the brigade which had been raised by the Peshwa in 1813 and drilled and officered by Englishmen was placed under British control and called the Poona Auxiliary Force. [This brigade was chiefly composed of men from the Company's districts in Hindustan. On entering the battalion the men took an oath of faithfulness to the Peshwa, but, of their own accord, they added the proviso, so long as the Peshwa continues in alliance with the British Government.] In July the Peshwa went on a pilgrimage to Pandharpur and from Pandharpur to Mahuli the sacred meeting of the Yenna and the Krishna near Satara. At Mahuli he was visited by Sir John Malcolm, the Governor General's Agent for the Deccan. The Peshwa complained of the harshness of the recent treaty. At the same time he professed so warm a regard for the British, and so fully admitted his dependence on British support, that Sir John Malcolm was satisfied that whatever his feeling might be, interest would force him to remain friendly. He advised the Peshwa to show his goodwill to the English by joining with them in putting down the Pendharies. Nothing, Bajirav declared, would give him more pleasure than to take part in this work, and, with this object, Sir John Malcolm allowed him to enlist fresh troops. Mr. Elphinstone had no faith in Bajirav's promises, and, by the help of two friends, Yashvantrav Ghorpade a Maratha, and Balajipant Natu a Brahman, was kept informed of Bajirav's plans. Bapu Gokhle was made chief minister and nearly a million sterling was given him to ensure the support of the Maratha chiefs and nobles. Bhils and Ramoshis were enlisted and special missions were sent to Nagpur and to the camps of Holkar and Sindia. On the 5th of September the Governor General, informed by Mr. Elphinstone of the Peshwa's designs, wrote to the Directors: ' We cannot rely on the fidelity of the Peshwa except when it is ensured by the immediate sense of our power. The persevering perfidy of his attempts, after the most solemn assurances of contrition for the past, and of scrupulous good faith for the future, forbid any reliance on him. [Pendhari and Maratha War Papers, 114, 115.]

On his return to Poona, at the end of September, the Peshwa continued to push on his preparations for war. His army 'was strengthened, his forts were repaired stored and garrisoned, and orders were issued to make ready his fleet. Of two parts of the scheme the Peshwa took personal charge, the Resident's murder and the bribery of the British troops. Gokhie opposed Mr. Elphinstone's murder and the attempt was put off till the arrival of Trimbakji Denglia and his Bhils. Great efforts were made to shake the loyalty of the British troops. The families of some whose homes were in Ratnagiri were seized and their destruction was threatened unless the men came over to the Peshwa. Large sums were spent in bribery. One native officer was offered £1000 (Rs. 10,000) and £5000 (Rs. 50,000) were advanced to an agent in the hope that he might corrupt some of the British officers. At their last meeting, on the 14th October, the Peshwa complained to Mr. Elphinstone of his loss of power. He still professed friendship for the British and promised to send his troops against the Pendharies as soon as the *Dasara* was over. On Dasara Day, 19th October, Bajirav held a great review. He treated the Resident with marked discourtesy, and during the review allowed a body of horse to dash down on the British force as if to attack it. After the *Dasara*, instead of sending his troops against the Pendharies, he kept increasing their strength by summoning fresh parties from all sides.

Mr. Elphinstone was satisfied that the Peshwa would attack him before many days were over. Messages were sent to hurry on the European regiment on its march from Bombay, and to General Smith, who was at Ahmadnagar, to keep a force ready at sirur Besides Mr. Elphinstone's escort of two companies of Bengal Native Infantry at the Residency and the Peshwa's battalion [The details were: about 500 infantry, a few cavalry, and three six-pounder guns.] of the poona Auxiliary Force under Major Ford at Dapuri, the British forces consisted of about 1200 men of the Sixth and Seventh Regiments of Native Infantry [The details were: second battalion I. Regt. N. I., second battalion VI. Regt. N. I., and first battalion VII. Regt. N. I.] and two guns under the command of Colonel Burr, who were camped at Garpir on the right bank of the Mutha river. This position, which is near the Collector's office close to the northern outskirts of Poona, had been chosen in 1803 by the Duke of Wellington to guard the town. It was well suited for guarding the town, but, with an unfriendly force in the city, the position was far from safe. High-hedged gardens coming close to the lines gave assailants an easy approach and the disaffected a safe escape. On the 25th and two following days bodies of horse camped round the British lines, a strong corps of Gosavis took a position on the Vanavdi uplands to the east, and the Vinchurkar's horse with some infantry and guns posted themselves to the west between the Residency and Bhamburda village. The Maratha commanders were eager for an immediate attack. On the night of the 28th their guns were yoked, their horses saddled, and their-infantry ready to advance. But the Peshwa wavered and the night passed in consultation. Next day (29th) Mr. Elphinstone sent to the Peshwa complaining that his troops were pressing on the British lines and asking him to order them to withdraw. The message caused great excitement. Gokhle was for instant attack. But again the Peshwa was undecided. The work of winning over the British troops was not yet completed and every day was adding to the Maratha strength. Another night passed in consultation and next afternoon. A forced march of about thirty miles brought the European regiment into the Garpir cantonment On the first of November, leaving a company to guard Garpir and 250 men to strengthen the Resident's escort, Colonel Burr's force, about 800 European Infantry and 1200 Native Infantry with six guns. [The details were: The Bombay European Regiment, two battalions I. Regiment N. I., two battalions VI. Regiment N. I., and one battalion VII. Regiment N. I. Of the six guns two were iron twelve-pounders, the four were apparently six-pounders. See Blacker's Maratha War Memoir, 64.] crossed the Mutha and marched three miles north to Kirkee. North of Poona, across the Mutha river, with the Bhamburda hills on the west and the Mula winding along the north and east, stretches a slightly rolling plain. Except a belt of arable land on the left bank of the Mutha and a fringe of watered and fenced gardens along the right bank of the Mula, the plain is bare and open. Beyond the end of the Bhamburda hills a low ridge stretching north-east rises slightly to the village of Kirkee, driving the Mula north in a deep bend that half surrounds the village. The camp was pitched in the low land to the east of the village, the left resting on Holkar's Bridge (75) and the right on the rise of Kirkee village, the site of the Powder Magazine. This rising ground commands the plain, which, With one or two slight dips and rises, falls south to the line of the Poona-Bombay road. Behind the road to the right stretch the Bamburda or Ganeshkhind hills, and, to the left, beyond the Mutha valley, rise the sharp temple-crowned peak of Parvati and the distant Sinhgad hills. About a mile and a half west of the Kirkee camp, on the left bank of the Mula, lay Dipuri, the head-quarters of Major Ford's battalion; about a mile to

the east was Holkar's Bridge; and nearly three miles to the south, long the right bank of the Mula, lay the Residency with a garrison of about 400 men. The straight road from Kirkee to the Residency passed along the right bank of the river, but there was a second path over Holkar's Bridge along the left bank of the Mula and across a ford just behind the Residency. On the first and second of November Colonel Burr prepared a post at Kirkee for his stores and munition and Mr. Elphinstone examined the ground near Kirkee, fixed a ford for the passage of the Dapuri guns, and impressed on the commanding officers that if matters came to a crisis, the two British detachments should march out, join, and attack the Marathas. The withdrawal of the British from Garpir to Kirkee greatly encouraged the Marathas. Garpir was plundered; Lieutenant Shaw, an officer of the Bombay army, on his way to Bombay was attacked, wounded, and robbed in open day by one of Bajirav's personal followers; the ministers spoke of the British with contempt, British officers were insulted, and Maratha troops pushed forward close to the Residency. Mr. Elphinstone warned the Peshwa that if they advanced further the Maratha troops would be treated as enemies, and ordered the light battalion and the auxiliary horse at Sirur to march into Poona. On hearing that the Sirur troops had been sent for, the Peshwa determined to wait no longer. He ordered the Residency to be destroyed and all the British killed except Dr. Coats, whose medical skill had once saved his life, and Major Ford, the commandant of the subsidiary force, if he agreed to stand neutral. Moro Dikshit, who was attached to Major Ford, visited him and tried to persuade him to remain neutral. But Major Ford refused to desert his countrymen and withdrew from Poona to his camp at Dapuri.

On the morning of the fifth, the din of preparation rose from the city, the Maratha troops drew closer to the Residency, and a battalion took ground between it and the company which had been left at Garpir. Mr. Elphinstone sent a message to the Peshwa calling on him to keep to his promise and lead his troops against the Pendharis. About two in the afternoon one Vithoji Naik Gaikwar came from the Peshwa. He told Mr. Elphinstone that his master had heard that the Resident had sent for reinforcements, that he feared that, as had happened in June, Poona would again be surrounded by British troops, and that if Mr. Elphinstone did not send away the European regiment, reduce the strength of the native brigade, and move the cantonment to a place to be named by him, the Peshwa would leave the city. Mr. Elphinstone replied that the Peshwa had no right to demand and that he had no power to order the British troops to be moved. Vithoji Naik complained and threatened and left warning Mr. Elphinstone that if he did not do as the Peshwa wished evil would come. As soon as Vithoji left Mr. Elphinstone called in the guard from Garpir, and sent Mr. Grant, afterwards Captain Grant Duff, along the ridge that stretches west to Bhamburda to watch what went on in Poona. Infantry were gathering on the slopes of the Bhamburda hills, and filling the space between the Residency and Ganeshkhind, and south towards the city, where it was not covered with corn, the lowland was full of horsemen. On Vithoji's return Bajirav was seen to withdraw to Parvati. For an hour the city was still. Then, about three o'clock, in spite of the ill-omened breaking of the staff of the Golden Streamer, Bajirav, satisfied of Parvati's favour, gave the order to attack. The masses of troops in front of the town began to move, and with the trampling and neighing of horses, the rush of riders, and the rumble of gun-wheels, endless streams of horsemen poured from every outlet of the town. From the fields between the city and the

Residency, scared by the uproar, antelopes bounded away, husbandmen fled, and bullocks broke from their yokes and galloped off. The moving wall of horsemen, with a roar like that of the Cambay tide, sweeping all before it, crushed the hedges and the standing corn, and, laying every barrier low, filled the valley from the river to the hills, To defend the Residency against such a host was hopeless. Messengers were sent to Colonel Burr at Kirkee and to Captain Ford at Dapuri directing them to move out, join their troops, and advance to meet the Marathas. Mr. Elphinstone and his escort of about 500 men forded the Mula behind the Residency, and, passing along the left bank of the river, crossed again by Holkar's bridge. They had hardly left the Residency when the Marathas dashed into the enclosure, tore up the trees, and setting fire to the buildings, burnt them to ashes, destroying Mr. Elphinstone's books and papers and everything he had except the clothes on his back.

At Kirkee, Colonel Burr, leaving his camp standing, and sending part of the second battalion of the Sixth Regiment and two twelve-pounder iron guns to guard the post at Kirkee, marched about a mile towards Poona. Here he was joined by the Resident with his guard. The Bombay European Regiment, the Resident's escort, and a detachment of the second battalion of the Sixth Regiment were placed in the centre, the first battalion of the Seventh Regiment with two guns on the left, and the second battalion of the First Regiment with two guns on the right. It was now about four o'clock, and after a short pause, as Major Ford's force was seen drawing near, Colonel Burr advanced to the attack.

The Marathas held a strong position about a mile and a half in front of the British. On the Maratha left the Vinchurkar's and Moropant's horse with the Golden Streamer held the base of the hill in front of Ganeshkhind, a line of infantry and fourteen guns filled the centre, and on their right towards the Residency lay a large body of infantry and cavalry, their front strengthened by a rivulet and walled gardens. Behind, back to the bank of the Mutha, the plain was full of horsemen line after line as far as the eye could see. As the British advanced, the fire of their right infantry caused much loss among the Maratha skirmishers and damped the Marathas' spirit as they had believed that the British sepoys would not fight. At Parvati the fainthearted Peshwa, seeing the ready advance of the British, lost courage, and sent word to Gokhle that he was not to fire the first gun. Gokhle, as he was riding up and down the tanks chiding and cheering his men, caught sight of the Peshwa's messenger, and, knowing what message he was likely to bring, opened a battery of nine guns, moved a strong corps of rocket camels to his right, and pushed forward heavy masses of cavalry, which, advancing at speed, swept over the plain nearly surrounding the small body of British troops. Major Ford was still about 1000 yards to the west of the British line, when Moro Dikshit and one of the Rastias, at the head of a large body of horse, eager to show that the Peshwa's suspicions of their loyalty were unfounded, charged Ford's battalion. Ford threw back his right wing, and, waiting till the enemy were close at hand, met them with so deadly a fire that, with the logs of their leader Moropant, they wheeled, to the left and passing on were finally scattered by the heavy iron guns posted at Kirkee. When Ford joined the main line two guns were moved from the right to the centre and the light company of the Seventh Regiment was sent to the rear to keep off the Maratha horse. Meanwhile, on the left, 3000 trained Arabs and Grosavis, under a Portuguese named De Pinto. [According to some accounts the

Portuguese tomb to the north of Garden Reach marks De Pinto's grave. This seems to be a mistake as De Pinto is mentioned (Pendhari and Maratha Wars, 129) after the battle of Kirkee as taking charge of Hunter and Morrison, two English cornets, who were captured by the Marathas on the Bombay road. See below, Uruli.] passing from the centre of the Maratha line along the enclosures and watered land near the Mula, reached the open plain, apparently near the ruined water-channel behind Rose Hill house, and formed in front of the first battalion of the Seventh and the second battalion of the Sixth Regiments. At sight of their red coats and colours the English sepoys pushed forward, and, in their eagerness to close, broke from the line. Gokhle saw the disorder, and, raising the Golden Streamer, followed by several of his highest officers and a picked body of 6000 horse, charged from the right along the British line. Seeing the danger Colonel Burr took his post with the colours of the Seventh, a regiment he had formed and led for years, stopped the pursuit of De Pinto's battalion, and called on his men to keep their fire and show themselves worthy of his training. As he passed along the line Gokhle's horse was wounded and he was forced to retire. Other officers took his place and they were dashing into the broken British line, when, close in front, the foremost horses floundered in a deep morass, and rolling over disordered the ranks behind and offered an easy aim to the British fire.

About 300 horsemen struggled through the morass and attacked the British flank, but were forced to retire before some companies of Europeans who pushed on to support the Seventh Regiment. [The account in the text, perhaps, explains the apparent discrepancy between Grant Duff's 6000 Maratha horse (653) and Blacker's (Maratha War Memoir, 65) 300 resolute Marathas, Neither side knew of this morass, It was probably due to the very heavy late rains. Grant Duff's Marathas, 653.] As the British line advanced, the Maratha centre and left withdrew driving off their guns. The strong body of infantry on their right sheltered by the stream bed and garden enclosures, for a time galled the British left. But skirmishers were thrown forward and they were forced to give way. The English now held the Maratha position, and as night was falling and the enemy were broken and scattered, pursuit was stayed and the British troops returned, Colonel Burr's brigade to Kirkee and Major Ford's to Dapuri, reaching their camps about eight at night.

The British loss was eighty-six killed and wounded, fifty of whom were sepoys and one, Lieutenant Falconer, a European officer. [The details are: Artillery, two lascars wounded; Bombay European Regiment, one private killed, one wounded; second battalion First European Regiment, one private killed, one Lieutenant (Falconer) died of his wounds, one *havaladar*, one *naik*, one waterman, five privates wounded; second battalion VI. Native Infantry, killed four privates, wounded ten privates; first battalion VII. Native Infantry, killed one *havaladar*, one *naik*, one drummer, nine privates; wounded one *havaladar*, three *naiks*, thirty-four privates. Major Ford's Battalion, killed one private; wounded one *jamadar*, one *havaladar*, five privates. Colonel Burr, Pendhari and Maratha War Papers, 125.] Of the Marathas 500, including the minister Moro Dikshit, were killed and wounded.

Two thousand eight hundred infantry, several of them disaffected and only 800 of them Europeans, broken into two bodies, almost without cavalry, and with only seven six-

pounder and two twelve pounder guns, in an open plain covered by the enemy's horse, had marched against and scattered an army of 20,000 cavalry and 8000 infantry armed with fourteen guns. [Besides this force, the Peshwa had 5000 horse and 2000 foot at Parvati. Grant Duff's Marathas, 654 note 1.]

Of the British troops the Marathas of Major Ford's subsidiary force deserted, and part of his newly raised horse were allowed to withdraw. But, of the regular sepoys, in spite of the Peshwa's bribes and threats, not one left the British colours. Colonel Burr, the commanding officer, though crippled by paralysis, laid his plans with wise care and in the thickest of the fight remained firm and cool. [Two of Colonel Burr's attendants were shot by his side, a ball grazed his horse's head and another went through his hat. Grant Duff's Marathas, 653 note 2.] The victory was mainly due to Mr. Elphinstone who had secured the presence of the European regiment, freed the troops from the dangers of their former camp, planned the meeting of the two divisions of the force, insisted on an advance in spite of the openness of the plain and the doubt of Maratha horse, and throughout the day inspired the troops by his brilliant gallantry.

Kirkee Catholic Church(81).

Vincent de Paul's ROMAN CATHOLIC CHURCH building, 107' 6" long by 42' 3" broad, is 120 yards north-east of the Kirkee Artillery Mess and 362 miles from the Poona post office. It was originally a Protestant church.

Kirkee Christ Church(82).

CHRIST CHURCH in the Artillery Lines at Kirkee and 3.75 miles from the Poona post office is 150 feet from east to west and seventy-five feet broad at the chancel. It was consecrated by Bishop Carr in 1841 and has seats for 600 persons. A brass is let into the floor in front of the west entrance and over it are two regimental colours. The brass bears the inscription: In commemoration of the past history of the 23rd Regiment, Bombay Native Light Infantry, the above colours, are, by permission, placed in this church, 1870.

In front of the reading desk is another handsome brass to the memory of Captain Arthur Carey, of the Royal Horse Artillery. The church has several handsome tablets erected by regiments to officers and men of their corps who died during service in India. There is a tablet to three officers of the Fourth Queen's Own Light Dragoons, who died in Sind in the Afghan campaign of 1838, and one to thirty officers of the 14th King's Light Dragoons, who died between 1841 and 1859, twenty-five of them killed in action. A third tablet is to ninety non-commissioned officers of the same regiments, who died or were killed during the same campaigns, three of them in action at Ramnagar in the North-West Provinces. There are two other tablets to officers of the same regiments.

Lakdi Bridge Lake Fife (83).

LAKDI BRIDGE. See above Bridges (pp. 284-285).

LAKE FIFE [Contributed by Mr. J. McL. Campbell, C. S.] can be most easily reached by the Poona and Sinhgad road. The dam, which is at the end of the lake nearest Poona, is about ten miles south-west of St. Mary's church (109). Between Parvati hill (90) and Khadakvasla village the road thrice crosses the Right Bank Canal. On nearing Khadakvasla the great masonry dam 3687 feet long and ninety-nine feet high, rises above the village and over a fine grove of young *babhul* trees in the old river bed. The lake itself does not show till the dam is almost reached, when the lowest stretch, about two miles long and three quarters of a mile broad, comes into view. From the first stretch the lake winds about eleven miles up the valley, nowhere broader than three quarters of a mile, like a broad river rather than a lake. In sailing up the lake, on the south, beyond a level belt of cropped land, stands the mass of Sinhgad, its lower teak-clad spurs and ravines rising into bare slopes with patches of hill tillage, crowned by the lofty wall-like scarp of the fort; to the west Torna tops the nearer ridges; and to the north bare slopes with a few stunted teak trees lead to the groups of rounded hills of which Bhanbava is the centre. The banks of the lake are bare. No weeds or reeds fringe the margin, and, except a patch of mangoes and *babhuls* on the south bank near the dam, the upper slopes are treeless. Following the windings of the lake, about eight miles from the dam, the village of Sangrun and a large banian tree mark the spot where the Mutha from the north joins the lake almost at right angles. When the lake is full an arm stretches about three quarters of a mile up the Mutha, and the main body passes up the Musa valley narrowing and winding between steep lofty banks. Four miles beyond Sangrun, at the village of Kuran, on the north bank of the lake, is the meeting of two streams both of which bear the name of Musa. When full the lake passes a little more than a mile up the northern Musa and a mile up the southern Musa. Both of these branches are very narrow as, at its greatest height, the lake does little more than fill the river beds. About the end of May, when the lake is at its lowest, its water does not pass up the Mutha and not more than a mile and a half up the Musa beyond Sangrun. From singhad even when it is full Lake Fife makes little show. The broad lower reach near the dam is seen, but many of the upper windings are hidden by spurs of the hill and by the high banks of the lake. Except a few watercourses and spits of soft soil, the hard bare banks of Lake Fife offer neither food nor cover for birds. There are no weeds rushes or other water plants, no islands, and no part-sunk trees and bushes, only a broad unbroken expanse of deep blue water washing a clean, bare, and hard shore.

Such [Contributed by Mr. H. Wenden, C. E.] a lake can have no large number either of resident or of migrant birds. During the hot season, until the end of September, hours may be spent on the lake without seeing a dozen different kinds of birds, and even during the cold weather, when the number of kinds greatly increases, considering the vast sheet of water and the wide range of bank, the number of birds on or by the lake is very small. The few moderately large flights of coots duck, and teal that, at suitable seasons, appear on the lake seem to resort to it only as a safe midday resting place when they cannot remain undisturbed in the neighbouring watercourses and other feeding grounds. Fifty-five kinds of birds have been noted: The Bald Coot *Fulica atra*, the Blackbacked Goose *Sarkidiornis melanonotus*, the Whistling Teal *Dendrocygna javanica*, the Ruddy Sheldrake *Casarca rutila*, the Shoveller *Spatula clypeata*, the Spottedbilled Duck *Anas pacilorhyncha* the Gadwall *Chaulelasmus streperus*, the pintail Duck *Dafila acuta*, the

Wigeon *Mareca penelope*, the common Teal *Querquedula crecca*, the Bluewinged Teal *Querquedula ciria*, the Redheaded Pochard *Fuligula ferina*, and the Tufted Duck *Fuligula cristata*. Occasionally on a muddy spit or bank may be seen a small group of Flamingos *Phoenicopterus roscus*, some Spoonbills *platalea leucorodia* making a short halt in their migration, some Pelican Ibis *Tantalus leucocephalus*, and Shell Ibis *Anastomus oscitans*. The mournful whistle or the sight of the Curlew *Numenius lineatus* is rare, and, though so numerous by other Deccan lakes, the Demoiselle Crane *kalam* or *Anthropoides virgo* is only occasionally seen. The Black and the White Storks *Ciconia nigra* and *C. alba* are rare visitants. The Night Heron *Nycticorax griscus* is not common. The Whiteneked Stork *Melanopelargus episeopus*, the Blue Heron *Ardea cinerea*, the Large the Smaller and the Little Egrets *Herodias torra* *H. intermedia* and *H. garzetta*, the Cattle Egret *Bubulcus coromandus*, the Pond Heron *Ardeola grayii*, the Small Swallow Plover *Glareola lactea*, the Indian Ringed Plover *Egialitis curonicus*, the Redwattled Lapwing *Lobivanellus indicus*, the Yellowwattled Lapwing *Lobipluvia malabarica*, the Little Stint *Tringa minuta*, the Spotted Sandpiper the Green Sandpiper and the Common Sandpiper, *Actitis glareola* *A. ochrophus* and *A. hypoleucus*, the Greenshanks and the Little Greenshanks *Totanus glottis* and *T. stagnatilis*, and the Stilt *Himantopus candidus* are all fairly common. Here and there may be seen clusters of the Little Cormorant *Phalacrocorax pygmaeus*, and more rarely the Little Grebe *Podiceps minor* and the Indian snake-bird *Plotus melanogaster*. Three specks of Kingfishers *Halcyon smyrnensis*, *Alcedobengalensis*, and *Ceryle rudis*, are fairly common, as are the Small Marsh Tern *Hydrochelidon hybrida*, and the Black-bellied Tern *Sterna melanogastra*. The Gullbilled Tern *Gelocheli- don anglicae* is less common. Of Snipe, the shores of the lake have practically none but a very few of four species, the Pintailed the Common and the Jack *Gallinago sthenura*, *G. gallinaria*, and *G. gallinula*, and the Painted Snipe *Rhynchoea bengalensis*, together with a few specimens of the Pheasant-tailed Jacana *Hydrophasianus chirurgus*, the Water Hen *Gallinula chloropus*, and the White-breasted Water Hen *Erythra phoenicura*, frequent the reedy patch of marsh and pool which lies close below the great dam. Close below the dam, in the early morning and evening when they are in flight to and from their feeding grounds a few duck and teal, and, by beating, a few snipe may be shot. At several points along the canal between the Lake and Parvati are marshy patches which occasionally hold snipe and teal. Still on the whole, even with the aid of a boat on the lake, little sport can be had at Lake Fife.

Of the eighty-six kinds of shore and water birds which are known to frequent the Deccan these fifty-five have been noted at Lake Fife. The list is not exhaustive as the locality has not been closely studied. The knowledge of the lake is also incomplete.

Twenty-one species of fish have been taken and noted. These are *Ambassis nama gande-chiri*, *Gobius giurus kharpa*, *Mastacembelus armatus vambat* or *bam*, *Ophiocephalus striatus dakhu*, *Ophiocephalus leucopunctatus maral*, *Macrones seenghala* and *M. cavasius singhhala* or *shengal* and *shingti* or *shingata*, *Rita pavementata ghogra*, *Pseudentropius taakree vaidi* or *vayadi*, *Callichrous bimaculatus gugli*, *Wallago attu shivada* or *pari*, *Discognathus lamta malavya*, *Cirrhhina fulungee loli*, *Rasbora daniconius danalan*, *Barbus sarana kudali* or *pitule*, *Barbus nexastichus khadchi*, *Barbus malabaricus kavla*, *Barbus kolus kulis* or *kholashi*, *Barbus ambassis bhondgi*, *Rohtee vigorsii phek*,

Lepidocephalichthy thermalis chikani, *Nemacheilus savona mura*, *Notopterus kapirot chalat* or *chambaree*. [Some of these identifications are doubtful. Mr. H. Wenden, C. E.]

Of these twenty-one species the writer has taken only two with rod and line, the *pari* Wallago attu up to nineteen pounds in weight and the fish he supposes to be *Barbus malabaricus* up to twelve pounds. The best way of fishing is trolling from a boat with spoon or natural bait on what is known as the Thames snaptackle, with at least forty yards of line out and with a sinker between the trace and running line. The great secret is to fish deep. The boat on the lake can usually be secured through the courtesy of the Executive Engineer for irrigation and men to row it can be hired from the village of Khadakvasla.

Military Accounts Offices(84).

The MILITARY ACCOUNTS OFFICES, a large two-storeyed stone building, is in suburban municipal limits about 650 yards south-east of the railway station. The original main block of this building was built by a Mr. Mervanji Jamsetji for a hotel, but in 1835, before it was finished, on the recommendation of a committee, it was bought for Government for £35,000 (Rs. 3,50,000). It stands on the Government books at a value of £43,129 18s. (Rs. 4,31,299). In this building are the offices of the Controller of Military Accounts, the Military Accountant and Compiler, the Examiner pay Department, the Examiner Ordnance Department, the Examiner Medical Department, the Examiner Commissariat Accounts, the Judge Advocate General, the Commissary General, and the Military Fund Office.

Objects Military Prison (85).

The MILITARY PRISON is the Central Military Prison of the Bombay Presidency for offenders among the European troops. It is a group of substantial masonry buildings along a rocky ridge to the south of the cantonment and near the Vanavdi Barracks. Except the warders' quarters all the buildings are within an enclosure 700 by 1125' surrounded by a fourteen feet masonry wall. The prison has room for fifty prisoners in two blocks, each of twenty-five solitary cells. Two more blocks, each with twenty-five cells, were built in 1881. The ventilation and sanitary arrangements are on the most approved modern principles. Besides the four blocks, with twenty-five cells in each, the prison buildings include a cookhouse, a work-shed, a chapel library and school, a hospital with out-houses, apothecary's quarters, a guard-house, and a lavatory with a detached block of eight quarters for warders. The prison was built by Colonel A. U. H. Finch, R. E. Executive Engineer Poona, and designed, by him chiefly from standard plans. It was completed in 1876, and with the additions has cost £17,682 (Rs. 1,76,820).

Musalman Graveyard (86).

Details of the MUSALMAN GRAVEYARD to the south of the Collector's office are given above under Grarpir the Quartz Saint (68).

Napier Hotel.

The NAPIER HOTEL on Arsenal Road built in 1868 is now the property of a Joint Stock Limited Liability Company. It is an upper-storeyed building in four blocks with large porches and a garden over 300 yards long with four fountains. The roof is flat and the tops of the walls are cut in the form of battlements. The hotel has room for fifty-five to sixty visitors with a drawing room (42'x30'), dining room (20'x50'), billiard room (36'x16'), and forty-five bed rooms some of them double rooms for families, including a sitting room, a bed room (18' x 16'), two bath rooms, and a dressing room. It is also provided with large stables.

New Jhansi Barracks (88).

The NEW JHANSI BARRACKS in Kirkee, 3.27 miles from the Poona post office, consist of sixteen blocks each with room for twenty-four men. Besides the barracks the buildings contain quarters for a sergeant-major, conductor, schoolmaster, and quartermaster sergeant, married men's quarters for twelve, a school-room, a quarter-guard store-room and lock-up, work-shop, pontoon shed, armourer's shop, solitary cells, and latrines. Attached to the barracks is a hospital with eight out-houses.

Panchaleshvar Temple (89).

Beyond the College of Science, about 400 yards south-east, where the Ganeshkhind road crosses the railway, 1.95 miles from the Poona post-office, is a knoll topped with trees and white Musalman buildings. At the north foot of this rising ground a path to the right leads down a cutting between side walls of rock, six to eight feet high, into a rectangular enclosure which has been cut out of the rock. In the centre of the enclosure, part of the rock about twelve feet high has been left, and hewn into a circular porch or pavilion with a bull in the centre. Four massive square central pillars support the roof. But several of an outer circle of pillars with parts of the roof have fallen. From the porch a short passage leads to a rock-hewn temple of Mahadev. It is a large hall with little ornament and several rows of large square pillars. In a shrine opposite the door is a *ling* which is known as PANCHALESHVAR. The walls and the pillars are covered with modern paintings of the Pandavs and of some of the wonders worked by Mahadev. When visited in 1882 the temple was inhabited by a band of Gosavis or Bairagis who had made several small modern shrines and prevented the details of the cave being examined.

Parvati Hill (90)

PARVATI HILL, 3.23 miles from the Poona post office, is the bold temple-topped rock which, with bare stony sides rises 2111 feet above mean sea level or 261 feet above the city between it and the lofty line of the Sinhgad hills. It is about 500 yards south of the city limits and by the Sinhgad road 3.23 miles south-west of the post office. Up the east face of the hill runs a broad paved stairway with steps about a foot high and two or three feet wide and on the left a wooden rail. At the foot are two small stone monuments, one a pillar about a foot high and two feet round called Nagoba or Father Cobra. At the top of the pillar a circle of hooded snake-heads surrounds a central cobra whose head has been broken off. The other monument, a square stone pillar about four feet high, raised to mark

a Sadhu or holy-man's grave, has its eastern face ornamented with the image of a man on horseback. About halfway up the hill a little altar on the left with several foot-prints carved near it, marks the spot of the last widow-burning in Poona. According to the Brahmans of the hill this sacrifice took place in 1832. The woman's name was Parvati and her husband was Madhavrav one of the temple Brahmans. At the top of the paved stairway the north-east crest of the hill is crowned by a high building, the under part of cut-stone, and the two upper storeys of plain brick. The southern crest of the hill is crowned by a long line of roofless square-windowed buildings three storeys high, the ruins of a palace which was begun by the last Peshwa Bajirav (1796-1817). It was never finished and the completed parts were destroyed by lightning, it is said, in 1816 the year before the battle of Kirkee (5th November 1817).

On entering the main temple, on the north-east corner of the hill, to the right is a two-storeyed brick building, the ground floor with plain square teak pillars used as a rest-house and the upper floor as a drum-room or *nagarkhana*. The gate on the left opens on an eight-sided courtyard surrounded by a brick and cement wall about sixteen feet high. In this wall are a row of rest rooms, large niches or open chambers about four feet deep and eight long with pointed arched ceilings. On the top of the wall, with a broad parapet on the east and west sides, runs a passage with an outer battlemented wall about four feet high provided with loopholes. In the centre of the enclosure is the chief temple of Shiv, a rather handsome building in the ordinary modern Hindu style with a spire and gilt top, on a plinth about a foot above the general level. At each corner of the plinth is a small domed shrine, to the Sun in the south-east, to Ganesh in the south-west, to Parvati or Devi in the north-west, and to Vishnu in the north-east. Under a stone canopy between the temple and the east entrance gate sits a large black bull. In a separate enclosure to the west of the main temple is a smaller temple to Kartik Svami. To the south is a third temple to Vishnu. All three are in much the same style, in no way different from ordinary modern Hindu temple architecture. Round the southern and south-west crest of the hill are the remains of Peshwa Bajirav's palace which seems to have been planned to surround the crest of the southern half of the hill with a circle of buildings, three storeys high and one room deep. The palace was never completed and what was finished was destroyed by lightning. The north face of the chief temple wall, from which it is said Bajirav watched the battle of Kirkee (5th November 1817), commands a complete view of Poona and its neighbourhood. [To follow the battle Bajirav must have used a telescope. Perhaps he used the very telescope presented to him from the East India Company by Lord Valentia in 1803, See Valentia's Travels, II. 128.] To the north, beyond the bare rocky slopes of Parvati hill, dark-green clusters of mango trees and golden-green patches of sugarcane are broken by house roofs and the gray stone towers of Garden Reach. To the north-west are the trees and houses of Bhamburda and further off the bare Ganeshkhind upland. To the north wind the tree-fringed banks of the Mutha and the Mula, and, from the woody Kirkee plain beyond, stand out the English and the Catholic churches, the Artillery Barracks, and the Powder Works. Beyond Kirkee stretches a bare plain with broken irregular hills the chief peaks being Khandeshvar in Khed and the flat-topped range of Chaskaman. Towards the north-east, behind Parvati lake with its rich mangoes and cocoa-palms, rows of roofs stretch, thick and brown, shaded by trees, and here and there broken by high house-tops and white Hindu spires. The railway and

Wellesley bridges span the Mutha, and across the Mula stands the Deccan College, and still further, on the border of the bare plain, the Yeravda jail. To the east, beyond thick house roofs, from among the trees of the Civil Lines and Cantonment, rise the towers of the Sassoon Hospital and the Council Hall, the red tower and spire of the Synagogue, the gray belfry of St. Paul's and the Arsenal water tower, and the white spires of St. Mary's and St. Patrick's churches. To the east, along the line of the Mutha canal, beyond rich orchards and sugarcane fields, a bare stony belt leads to the high ground on which stand the Vanavdi European Infantry Barracks and the Military Prison. To the south-east and south the woods in the foreground are thinner and more stunted and the land rises in a bare low ridge on which, among a few trees, stand the Parsi Towers of Silence. To the south, the ground, without houses and thinly wooded, rises to bare uplands, and behind the uplands stretches the long range of the Sinhgad-Bhuleshvar hills ending westwards in the bold scarp of Sinhgad fort. To the south-west, green with tillage and timber, lies the valley of the Mutha with the waters of Lake Fife brightening the distance. Behind the lake stands the lofty crest of form and to the west the bare Bhamburda hills rise to the central peak of Bhanbava.

Close to the north of Parvati hill, between the foot of the hill and the bank of the Khadakvasla canal, on the northern outskirts of Parvati village is one of the circles of rude stones which, over most of the Bombay Deccan, are set up in honour of Vetāl, the Ghost King or Demon Lord. A rectangular space, about thirteen yards broad by sixteen long, is marked by a ring of undressed stones most of them roughly conical. They vary in height from about six inches to a foot and are three to four feet apart. All are coated with whitewash and tipped with redlead. In the middle is a rough plinth about twelve feet square and two feet high, and in the middle of the plinth are two undressed stones about two feet high and between two and three feet round. The central stones are Vetāl and Mhasoba who is properly the brother of Vetāl, though the Parvati people seem to consider them the same. The outside ring of stones are Vetāl's guards or sepoys. Twice a month, on the full-moon day and on the no-moon day, the village Mhar paints the stones with whitewash and tips them with redlead. On Friday evening a Teli or oilman comes and offers flowers betel-leaves and a cocoanut. No animal is sacrificed except an occasional goat in fulfilment of a vow. The stone dwellings for Vetāl and this circle of guards are said to have been put up by the Mhars when Parvati village was founded. [This circle of Vetāl stones does not differ from the Vetāl circles found near many Deccan villages. The circles are generally outside of the village and near the houses of one of the early or depressed classes, the Mhars or the Ramoshis. This Poona circle has the interest that it has been figured in Colonel Forbes Leslie's *Early Races of Scotland*, who suggests a connection between these circles and the stone circles found in England, Western Europe, and other parts of the world. Though they seem to have no direct connection it may be suggested that the original object both of Indian and of English stone circles, as well as of the Buddhist rail round burial mounds, is the same, namely to keep off evil, that is evil spirits, from the central stone or mound. A guardian circle is equally wanted whether the object to be guarded is a stone in which a spirit or god lives, a tomb in which the relics (and the spirit) of the dead remain, or a stone of judgment or an altar stone both of which probably in most cases were also Bethel's or guardian's houses. That during his crowning, when he is especially open to the attacks of the evil eye and

other evil influences, the king sits on the holy or guardian-possessed Scone stone suggests that the origin of the old British judgment stones may have been guardian-possessed seats for the elders of the tribe. In this connection the value of the Vetāl circle is that it keeps fresh the early guardian idea. The centre stone is the god's house; the stones in the circle are the houses of the god's watchmen. Apparently Vetāl's guards have no names. The only one of Vetāl's guards who is known by name in the Deccan is Bhangya Bava. Whenever offerings are made to Vetāl in fulfilment of a vow a *chilim* or hubble-bubble filled with hemp is offered to Bhangya Bava who takes his name from *bhang* or hemp-water of which he is said to be very fond. The other guards seem to be chosen by chance out of the hosts of *bhuts* and *pishachs*, that is ghosts and spirits of whom Vetāl is the lord and leader. The fact that Vetāl is shown holding a cane, *Vet* or *bet*, as a sceptre, and that sometimes a cane, which is the exorcist's great spirit-scarer or *bhut-lord*, stands for Vetāl, suggest a connection between the words *vet* and Vetāl. Twice a month at midnight on the full-moon and on the no-moon, like the Furious Host of early Europe (compare Stallybrass in Grimm's Teutonic Mythology, 918-950), Vetāl, followed by crowds of spirits each with a torch in one hand and a weapon in the other, passes in ghostly state, clad in silver and gold, with richly trapped elephants horses and litters. Lucky is the man who sees the host, though he generally falls in a swoon, and still luckier the man who, trusting to some spell, walks to the god's litter and asks his favour. Vetāl is human in shape, a man of a fierce and cruel countenance. He wears a green dress and holds a cane in his right hand and a conch shell in his left. He also holds in his hands a rosary of twenty-one beads of the *rudraksh* *Eleocarpus lanceolatus*, a piece of burnt cowdung, and some flowers of the *rui* *Calotropis gigantea*, a bush which he usually fastens to his right wrist and of which like the monkey god Hanuman he is very fond. Vetāl dislikes women and never possesses them. A man whom Vetāl possesses is held lucky and his advice is sought in all troubles. Though, as has been noticed above (p. 348) in the account of Vetāl's temple in Vetāl ward, some Vetāls rise to a good social position and are worshipped by Hindus of all classes high class Hindus, as a rule, hold the ordinary Vetāl worship discreditable, and except stealthily, seldom perform it. The lower orders believe in Vetāl, worship him and pay him vows. His devotees are mainly of two classes sorcerers and at times Vetāl is the sorcerers' god, because sorcerers wish him to give them some of his power over spirits; he is the athlete's god apparently because of the strength and activity shown by a man into whom Vetāl has entered.

That both in the Deccan and in the Konkan special offerings are made to vetāl by his votaries on the *Mahashivrātra* Day, that is the big day of the god Shiv; that Vetāl like Maruti, whom Hindus admit to be an incarnation of Shiv or Mahadev is specially fond of *rut* *Calotropis gigantea* flowers; that like Mahadev he is fond of *bhasm* or ashes and of the *rudraksh* or beads of the *Eleocarpus lanceolatus*; that like Mahadev he is the king of spirits; and the belief of some Konkan votaries of vetāl that he is an incarnation of Mahadev suggest that Vetāl is an early form of Mahadev or the great god.

Intermediate between Vetāl and Mahadev, higher in phase than Vetāl and lower than Mahadev, comes Ganpati or Ganesh, who, as his name shows, like Vetāl and like Mahadev, is the lord of spirits. Though the ideas that surround Vetāl and Ganpati are ruder and earlier than those of which Mahadev is the centre, it is worthy of note that, like

all the gods of modern Brahmanism, all three phases have risen from the early destructive to the more modern guardian stage. In his character of guardian, to each phase of the Ghost Lord, one of the chief healers or spirit-scarers has been added, the cane to Vetāl, the elephant to Ganesh, and the *ling* to Mahadev.]

In the Konkan, where his worship is more general among the middle-classes than in the Deccan, Vetāl's great day is *Mahashivrātra* in February; in the Deccan special offerings are made on that day also, but his chief times appear to be *Holi* in March - April and *Dasara* in September - October. At these times Vetāl's stone is whitewashed and tipped with redlead, and flowers, sandal paste, milk, butter, cakes, and occasionally flesh are laid before him. The offerings generally go to a Mhar or Mang who sits in the circle.

A few paces to the south-east of Vetāl and his guard is a round stone and cement block of rough masonry about three feet high and six feet across with a stone in the centre like a *ling*. To this central stone, during the time of the Peshwas (1714-1817), tigers used to be tied and be baited by elephants. The pillar is now worshipped as Vaghoba or Father Tiger.

Parvati Lake (91)

Parvati Lake, nearly rectangular in form about 550 yards long by 225 yards broad and covering an area of about twenty-five acres, lies about half a mile north-east of Parvati Hill and to the south of the city. The lake is a beautiful piece of water fringed with rich gardens and stately trees and with a woody island in the centre. The cost of making the lake and building the dam is said to have been £1357 (Rs. 13,570). The idea of making Parvati lake seems to have occurred after the building of the Katraj aqueduct which passes through and along the east of the lake. The stormwater overflow from the aqueduct used to drain into the Ambil Odha stream, which passed through the present lake and the waste of so much good water perhaps originated the Parvati lake project. The bed of the stream was dammed with masonry above and below the lake, and the intercepting channel below the lower dam was again dammed in three places to form smaller pools below. These smaller pools remain but are out of repair. The lake is still filled during the rains from the overflow of the Katraj aqueduct. Sluices, which are still worked, have also been made in the head dam to take the water of the Ambil Odha stream. The lake was a pleasing addition to the Hirabag or Diamond Garden where Balaji the third Peshwa (1740-1761) built a pleasure house. A neat flight of steps with intercepting paved landings lead from the pleasure house to the margin of the lake. The lake was begun in 1753 by Balaji (1740-1761) the third Peshwa. One day, according to the local story, when on his way to Parvati temple, Balaji, who was the most energetic of the Peshwas, looked at the works, and, enraged at their slow progress, got down from his elephant and began to pile the stones with his own hands. His retinue and officers followed his example and the dam was soon made. A piece of raised ground left in the centre to form an island was afterwards turned into a garden called the Sarasbag. A small temple of Ganpati was built some time after. Ganpati's ministrant has a monthly allowance of £1 10s. (Rs. 15) from the Parvati temple revenues.

Photozincographic Office (93).

The Photozincographic Office or Government Map office is within suburban municipal limits about fifty yards to the west of the post office. It fills a number of detached buildings some of them as old as 1831 and some built in 1868 and changed and improved in 1882. The buildings include an office (93' X 43'), a furniture store (33' x 17') a printing press house (45'x 23'), a draftsman's office (55'x 17'), two dwelling-houses, a room (75'X 16'), a store room (32'X 16'), and a new main press house (89' x 30').

Poona Hotel(93).

The Poona Hotel, within suburban municipal limits, at the corner of the Lothian and Bund Gardens roads, is about a hundred yards east of the post office and St. Paul's church. The hotel, which belongs to Messrs. Sorabji Jahangir and Sons, was opened on the 24th of May 1873 with eight bed rooms. It has now (1884) a large dining room (40' by 22'), a large drawing room (35' by 22'), twenty servants' rooms, and stabling for fifteen horses and eight carriages. The hotel has thirty bed rooms, twelve for families in a detached upper-storeyed building open to the westerly breeze and eighteen for single visitors. The hotel terms are £10 (Rs. 100) a month and 10s. (Rs. 5) a day.

Post Of (94).

The Post Office in suburban municipal limits, nearly half a mile south-east of the railway station, is an unpretending substantial structure designed and built in 1873-74 by Colonel Finch, R. E. at a cost of £1971 (Rs. 19,710). The post office includes three rooms (50' by 20'), (57' by 20'), and (16' by 20'), and quarters for the postmaster.

Race Course(95).

The Poona RACE COURSE, an oval 1½ miles and 31 yards in circuit, encircles the General Parade-ground, near the centre of the belt of open land that runs down the cantonment from north to south. The course lies between the Native Infantry lines in the west and the Soldiers' Gardens in the east, and its southern end passes close to the Sholapur road. It is a right-handed course with a straight run in of about a quarter of a mile from south to north, the finish with the Grand Stand and small Stewards Stand opposite being near the north-west corner. The open ground in the centre is used for general parades when all the troops of the garrison are called out on field days. The whole ground slopes from west to east. The Grand Stand in the high ground to the west is admirably placed commanding every yard of the course from start to finish. As the present building is of no use except as a place from which to view the racing it is under consideration to build a new stand with coffee, refreshment, dressing, and other rooms. The course has been in use for nearly thirty years. It has lately been widened and much improved by Colonel Burnett and is in excellent order. Since last year (1883) water has been laid on all round by pipes from the Khadakvasla canal. About one-third of the width at the outer side of the course is regularly used for training all the year round. The rest is closed by ropes, and watered when necessary so as to raise a good turf by the time of the

Race meeting (which always takes place in the month of September) to which horses come from all parts of India. The races are run on alternate days and the meeting lasts ten days to a fortnight. As till lately there were no professional book-makers in India, it was the custom to hold lotteries in the evening before each day's racing. For the last two are professional bookmakers from England have attended the Poona and other large meetings in India, and as a good business is done it is probable that the number of professional bookmakers will increase. The Poona meeting is very popular and the entries for the Arab races are always large. The two principal races are the Derby, for which in the last two years (1882-1883) the entries have been thirty-live and fifty-one and the Governor's Cup for which the entries have been fifty-two and sixty-six. The races are run under the Western India Turf Club rules.

Railway Bridge (96).

About 250 yards above its meeting with the Mula the Mutha is crossed by the Peninsula railway. The railway bridge, which is about 150 yards above the Wellesley bridge and is parallel to it, is 752 feet long and is of twenty-one thirty-feet span masonry arches. It is built of rubble masonry with coursed face work in the abutments piers and wings, and with brick work in the arches with stone ashlar arch quoins at the faces. [Captain Benson's Compendium, 3.]

Railway Station(97).

The RAILWAY STATION, half a mile north-west of the cantonment and 950 yards north of the post-office is one of the most important on the Great Indian Peninsula Railway line. The masonry buildings of the station comprise a station master's office, two waiting rooms, a telegraph office with fourteen signallers, a booking office, and a large third class waiting room. There are thirteen traffic and locomotive lines, ten of them sidings measuring $2\frac{3}{4}$ miles and three lines one the main line, another the platform line, and the third an alongside line. There are three platforms, the passenger platform 595' long 20' broad and $2\frac{1}{2}$ ' high, the horse-loading platform 307' long 20' broad and 3' high, and the goods, platform 605' long and $3\frac{1}{3}$ ' high with a varying breadth of 20' for 102 feet and of 47' for the remaining 503. The station yard with a greatest length of 845 yards and a greatest breadth of 155 yards covers an area of 93,651 square yards and is closed by a masonry wall. The yard has four gates to the east, two main entrances each $13\frac{1}{2}$ wide and on either side of these two small gates each 5' 2" wide, and on the south one main entrance 21 feet wide with two small gates each 5' 2" wide on either side of it. The station has four sheds, an engine shed, a goods shed, a carriage shed, and a store shed. The engine shed, 100 feet long 39 feet broad and 18 feet high, opens on the west and east. It is built of wrought-iron sides with corrugated iron covering and roof of wrought iron trusses and corrugated iron covering. The gables are of brick-work. The goods shed, 300 feet long 25 feet broad and $12\frac{1}{2}$ feet high, opens on the north side to the railways. It is built of teak posts and has a teak roof with double tile covering. The south side and two ends are enclosed with palisade fencing and teak boarding with gateways at every alternate bay. The carriage shed, 200 feet long $39\frac{1}{2}$ feet broad and $15\frac{1}{4}$ feet high, with its east and west ends open, is connected with the main line by rails. It is built of rubble masonry, teak

roof, and corrugated iron covering. The store shed, 200 feet long 25 feet broad and 16¼ feet high, opening at both ends, is connected with the main line by rails and with the outside by road. It is built of rubble masonry with double-tiled teak roof. [Benson's Compendium, 5-7.]

Royal Family Hotel(98).

The ROYAL FAMILY HOTEL is in the Civil Lines near the railway station. The hotel was started in 1861 by the present Parsi proprietor. It is an upper-storeyed building with room for five families and fourteen single visitors, and has stabling for sixteen horses and four carriages, and out-houses. The hotel has a drawing room (26' by 22'), a dining room (38' by 22'), a smoking room (22' by 13'), a billiard room (30' by 20'), and a hall (40' by 22'). The charges are 10s. (Rs. 5) a day and £12 (Rs. 120) a month.

Sangam(99).

The SANGAM or Junction at the meeting of the Mutha and Mula rivers, about a mile west of the post office, a pleasant house on the high river bank in a garden with fine old *pipal* trees, is the residence of the Judge of Poona who is also Agent for the Deccan Sardars. The Sessions Court-house is across the Ganeshkhind road about seventy yards to the south.

Santa Cruz (100).

On the right hand side going from Poona to Kirkee, on the bank of the small stream that runs into the Mula river at the north end of Garden Reach, in a small space surrounded by an open bamboo trellis fence about three feet high, are two plain whitewashed stone tombs. The larger tomb rises in pyramid form with five steps each about nine inches high from a square about six feet at the base to eighteen inches at the top, the whole surmounted by a plain stone cross about two feet high. There is another small cross at the foot and in the middle of the face of each step a small niche for an oil lamp. The smaller tomb is plain, altar-shaped, and about five feet long. It has a cross at the head and on the ground is a small stone slab with a cross cut in it. The crosses on the tombs are often hung with garlands of marigolds and chrysanthemums. The tombs are believed to mark the graves of Portuguese officers in the Peshwa's army who were slain in the battle of Kirkee (5th November 1817), but no certain information has been obtained.

Sassoon Hospital (101),

The SASSOON HOSPITAL within suburban municipal limits, about 450 yards south of the railway station, is one of the largest and handsomest buildings in or near Poona. It was begun on the 8th of October 1863 and opened on the 7th of October 1867. It was built at a cost of £31,006 (Rs. 3,10,060) of which £18,800 (Rs. 1,88,000) were contributed by the late Mr. David Sassoon, a wealthy merchant of Bombay. The building was designed by Colonel Wilkins, R.E. and the foundation stone was laid by the late Sir Bartle Frere, then Governor of Bombay. It is in the English-Gothic style, built of the local

gray trap, rectangular in plan, 227 feet long by 50 feet wide, its longer sides facing east and west. It is double-storeyed, the rooms having windows on both sides opening into arcades, so as to afford through ventilation and shade. On the ground floor, in the northern half of the building, are two male wards, one $47\frac{1}{2}$ feet by $23\frac{1}{2}$ the other $71\frac{1}{2}$ X $23\frac{1}{2}$ ', and in the southern half is a dispensary 22' x 234' and two male wards $47\frac{1}{2}$ by $23\frac{1}{2}$ '. On the first floors are rooms of the same size as those on the ground floor, those to the north being the Native female ward and the European female ward, and to the south one European male and one Native male ward. Over the porch is the operating room. At the south-west angle a masonry tower with a clock and water-cistern rises ninety-six feet, above which it carries a steep-pitched roof twenty-four feet high. The outbuildings include, besides those for cooking and servants separate quarters for three apothecaries, a dead house, and an infectious ward. A building to be used for a lying-in ward has been lately completed (October 1883) from a sum of £1000 (Rs. 10,000) left under the will of Mr. E. David Sassoon.

Science College (102)

The SCIENCE COLLEGE, on the main road between Poona and Kirkee, on the left or west side of the Mutha river, was built in 1869 at a cost of £18,164 14s. (Rs. 1,81,647), of which £5000 (Rs. 50,000) were contributed by Sir Cowasji Jehangir Readymoney. It is in the Saracenic-Gothic style built of the local gray trap and covered with a low-pitched tiled roof. In plan the building is nearly a square (111'x 109') and it may be best described as a large central hall ($62\frac{1}{2}$ ' by 30' and 42' to the top of the walls) covered by an open roof carried on iron arched girders, and surrounded on three sides by double-storeyed arcaded corridors $8\frac{1}{2}$ wide, round which central hall and opening into whose corridors are the other rooms of the college. The north-west corner of the building rises to a third storey and above that carries a square tower 67' from the ground to the eaves covered by a low-pitched tiled roof with overhanging eaves. Beneath the tower flights of stairs lead to the upper storeys. The porch is in the centre of the north face, and the entrance leads into a vestibule 13' by 20' having arched openings into the centre hall. On each side of the vestibule is a small office or room, and a passage leading on one side into the laboratory, a room 30' by 20', and on the other to the stairs leading to the first floor. To the east of the hall is a lecture room, 51' by 19', protected to the east on the outside by an open arcade, and another lecture room 29' by 20' having a similar arcade on its southern face. To the west of the central hall are three class rooms each 19' by 19'. On the first floor, over the vestibule, is a museum 49' by 20', and on the same face a lecture room 20' by 30'. To the east of the central hall are two lecture rooms one 50' by 19', the other $39\frac{1}{2}$ by 20' both shaded by outside arcades. To the west are three rooms one 30' by 20', and two 19' by 14'. On the second floor are the quarters of the Principal. The building was designed and built by Mr. W. S. Howard, C. E. Executive Engineer Poona and Kirkee, and completed in 1869. Attached are workshops and a foundry built at a cost of £282 (Rs. 2820) where the students do practical work under carpenters smiths and fitters.

Sindia's Tomb (103)

SINDIA'S TOMB or *chhatri* is on the left bank of the Bahiroba stream in the south-east corner of Vanavdi village three miles south-east of Poona. The *chhatri*, literally umbrella or pavilion, consists of a small hamlet of about forty houses surrounded by a fifteen feet Wall which runs about eighty yards north to south and fifty yards east to west. The chief entrance to the hamlet is on the south-west. Besides the houses there are three shrines inside the wall, small shrines of Maruti and Mahadev, and Sindia's *chhatri* which is an earth-filled temple thirty feet high, much like a grass-grown mound pierced by stone pillars. Mahadev's temple is a low building (40' by 25') with a wooden hall and a small shrine. Behind Maruti's temple is a wrestling pit. Close by is a stable containing a horse sacred to Mahadev which marches before the temple litter on procession days. The staff of the two temples, numbering about twenty-five people, are maintained by the present Sindia. [Mr. R. A. L. Moore, C. S.] The tomb belongs to Mahadji Sindia who died at Vanavdi in 1794 and was burnt on this spot. [Grant Duff's Marathas, 502.] About 1830 Jankoji Sindia, the great-grandson of Mahadji, began to build a large monument in memory of his great-grandfather but died in 1842 leaving the work unfinished Since Jankoji's death the tomb has enjoyed a yearly allowance of £350 (Rs. 3500) most of which is distributed among religious beggars on the anniversary of Mahadji Sindia's death which falls in February. [Colonel C. D 'U. La Touche.]

Small Arms Factory(104).

[Contributed by Lieut. Colonel Wake, R. A] The SMALL ARMS AMMUNITION FACTORY stands on the site of Kirkee village which was bought by Government for building a fort, the tracings of which were marked about 1868 though work has not yet been begun. [A committee is (July 1884) sitting to decide on the site and nature of a place of refuge which will probably be near the fort site and may perhaps supersede it, colonel Ducat, R, E,] The factory lies within the limits of the proposed fort, and consists of a main factory (200' by 100') with fifteen other buildings, the entire premises occupying eight acres of land enclosed by a rubble stone wall. The main factory has a boarded floor and a double roof in five spans, resting on iron columns twenty feet high and twenty feet apart braced together by longitudinal and cross girders. The roof is of corrugated iron without and lined with wood within. Between the corrugated iron roof and the wooden roof is an air space 1' 4" broad, and a Louvre board runs along the apex of each span from the inside of the factory to the outside air. This contrivance gives a through current of air between the two roofs and ensures perfect ventilation in the workshops. Of the fifteen other buildings, nine enclosing 7950 square feet are for the different processes of loading and filling cartridges; three outhouses and two small magazines are for laboratory work for making fuzes, friction tubes, rockets, long hights, and other war stores; and one is a store room (300' x 25'). All the buildings are connected with the main factory by a tramway 1' 6" wide with turn-tables in front of each room admitting lorries, thus leaving the tram line clear for wagons going to other departments.

The factory makes two kinds of cartridges Martini-Henry and Snider, both built varieties being formed of a number of parts put together. A Martini-Henry cartridge case is composed of twelve parts, an anvil, a base disc, a cap, a cap chamber, a case body, an inside and an outside cup, three jute wads, a paper wad, and a wax wad, a strengthening

coil, and a bullet 480 grains \pm 2 grains. After the case has been put together and the base disc rivetted to the cartridge by piercing and bending over the crown of the cap chamber on to the paper wad to form the rivet, the case is charged with eighty-five grains of R. F. G.2 powder. The charges are thrown charges from a Caffin's filling machine and the limit of error allowed is 85 grains \pm 2 grains. After the charge has been put into the case it is wadded with a solid wax wad 190" thick and on the top of this wax wad two jute wads are placed. The cartridge is then shaken to let the powder down into the case and bulleted with a bullet weighing 480 grains \pm 2 grains. The bullet has a diameter of .449" to .451" and a length varying from 1.28 high to 1.26 low. The bullet is secured in its place by two grooves made outside on the neck of the cartridge which press the brass of the case into corresponding grooves in the bullet. The E. F. G. 2 powder with which the cartridge is charged should vary in density from 1.72 to 1.75. It should contain not more than 1.2 or less than 0.9 per cent of moisture; and 85 grains of it fired from a Martini-Henry rifle with the service cartridge should give the bullet a muzzle velocity of 1290 to 1340 feet the second. [The velocity of the powder is taken with an electric instrument. In calm Weather the Martini-Henry cartridge should make a figure of merit at 500 yards. the mean of twenty shots not over fifteen inches.]

The Snider cartridge is also a built cartridge composed of an anvil, base disc, cap, cap chamber, inner base cup and outer base cup, case body, cotton-wool, and bullet. After the parts are put together the case is charged with seventy grains of R. F. G. powder with a density of 1.58 to 1.62. Half a grain of cotton-wool is placed over the powder and it is then ready to receive the bullet, weighing 480 \pm 2 grains, with a diameter of .573" to .575" and 1.03 to 1.05 long. The bullet is smeared with a beeswax lubrication .001" thick and fitted with a clay plug to expand the bullet and drive the lead into the grooves of the rifle when the cartridge is fired.

The factory is capable of turning out 45,000 Snider or 20,000 Martini-Henry cartridges a day. From want of room and supervision only one kind of ammunition can be made at a time. The making of breech-loading ammunition is intricate and difficult. To make one cartridge requires over 150 operations and the limit of error allowed in the different parts averages only about 2/1000 of an inch.

The machinery used is chiefly for punching and stamping. It is worked by three Lancashire double-flued boilers twenty feet long and six feet in diameter, two of which are generally used. The average daily consumption of coal is about 1¼ ton. A 2½" shafting, on supports 6' 8" apart, is carried on the columns and brackets from the girders. The shafting which makes 150 revolutions in a minute is driven by a high pressure engine of twenty horsepower direct from a belt from the flywheel on to the shafting. The shafting is lubricated with needle lubrications and the whole is driven by bands joining one line of shafting with another.

The factory establishment consists of about 400 workmen with a superior staff of twenty. The superior staff includes a Superintendent, a chief and an assistant engineer, two chief and five assistant foremen, and ten other overseers and clerks. The number of workmen taken and paid by the day averages 400 and sometimes rises to 800. Their monthly

wages vary from 8s. to £6 (Rs. 4- 60). The skilled workmen are Europeans born in India, Eurasians, Portuguese, Hindus, Musalmans, Parsis, and Chinamen, and the unskilled labourers are Marathas from the villages round Kirkee. Where possible the labourers are paid by piece work a system for which they have a great liking. They are hardworking and eager to make money.

Soldiers' Gardens (105)

The SOLDIERS' GARDENS cover forty-one acres on the left bank of the Mutha canal and of the Bahiroba stream in Ghorpadi about 250 yards north of St. Patrick's church on the east border of Poona cantonment. It was originally intended as a garden to be worked by the garrison troops. This idea was given up and for a time the gardens were kept by the cantonment authorities and then closed and given for tillage. In 1878 the gardens were revived and improved by Sir Richard Temple, then Governor, and placed in charge of the Executive Engineer Poona and Kirkee. A military band plays twice a week. During the present year (1884), because of their distance from Poona, the transfer of the Botanical Gardens from Ganeshkhind to the Soldiers' Gardens has been sanctioned and is (September) being carried out.

Soldiers' Institute (106).

The SOLDIERS' INSTITUTE and Assembly Rooms, near the centre of the cantonment about 140 yards north of the Gymnasium, consist of a permanent building tiled and in good repair. The building contains one main hall (89' by 63'), one exhibition room (70' by 25'), three lamp rooms (each 20' by 7' 6"), one store room (7' 6" by 10' 3"), one office room (20' by 7' 6"), two drawing rooms (each 17' 6" by 12'), and two bath rooms (each 5' 6" by 5' 6"). During the rains the building is used for the Soldiers' Annual Industrial Exhibition. At other times it is available for theatricals, pennyreadings, and other entertainments.

St, Andrew's Church (107).

ST. ANDREW'S Church in the Vanavdi Lines, set apart for the use of members of the Established Church of Scotland, was built by Government about 1861 and has room for about 500 people.

St, Anne's Chapel (108).

ST. ANNE'S CHAPEL in the Sholapur Bazar is of brick built in 1871 at a cost of £700 (Rs. 7000). The chapel, which is subordinate to the city Roman Catholic church of Nossa Senhora da Conceicao, has an altar, fourteen stations of the way of the cross, and two pictures of the Sacred Hearts of Jesus and Mary. The chapel has room for 350 and the congregation, consisting mostly of Goanese cooks and butlers, numbers about 225. A mass is held every Sunday and on obligation days.

St. Mary's Church (109).

ST. MARY'S CHURCH, within cantonment limits, on the high ground in the south-east corner of the Native Infantry Lines, is a large building with a belfry. It is 118 feet long and eighty-five feet broad at the chancel with room for about 900 people. It was consecrated in 1825 by Bishop Heber who describes it as spacious and, convenient but in bad architectural taste. In the interior are six lofty round pillars, two shorter round pillars, and two square pillars with tablets. The baptismal font is in the south-west corner of the church and is surrounded by handsome stained-glass windows. The church has numerous tablets, some of them belonging to officers of distinction. Here is buried Colonel Morris, C. B., famous in the battle of Balaklavs (1854) who died in 1858; and Lieutenant C. A. Stuart of the Madras Army who fell mortally wounded on the 28th of January 1858 while leading the men of the 4th Nizam's Infantry against a body of insurgent Bhils strongly posted at Mandvar in the Malegaon sub-division of Nasik.[Details are given in the Nasik Statistical Account p. 200.] There are also tablets to five officers of the 27th Bombay Native Infantry and five officers of the 8th Royal Regiment of Foot. One tablet is in memory of Captain Thomas Ramon who died on the 5th of November 1815 at Mandvi in Cutch. The 'Christian Temple' to which this tablet refers, as designed by his genius and built by his hand, is not St. Mary's but the large church in Kaira in Gujarat in which the tablet was originally meant to have been placed. Two other tablets are to Lieutenant J. W. McCormack of H. M's 28th Regiment who, on the 6th of October 1859, was killed at the storming of Bet in west Kathiawar with four non-commissioned officers and eight men; and to Major Henry C. Teesdale who fell in front of the colours of the 25th Regiment of Native Infantry when commanding it, at the battle of Meeanee in Sind on the 17th of February 1843. With Major Teesdale are associated the names of Lieutenant C. Lodge who was killed in action at Kotru in Kachh Gandava in Beluchistan on the 1st of December 1840, of Captain C. Rebenac, of Ensign Browne who was killed by accident at Karachi, and of eighteen other officers of the same regiment, one of whom, Colonel Robertson, was a C.B. and A.D.C. to the Queen. The church also contains tablets to Lieutenant Malcolm G. Shaw of the 3rd Light Cavalry who died of sunstroke at the battle of Beawra, and to Lieutenant Augustus Charles Frankland, with the motto 'Franke Lande, Franke Mynde', who was killed in a charge at the battle of Khushab in Persia on the 8th of February 1857. Another tablet is to Captains Seton and Peile and eighty-one non-commissioned officers and privates of the 1st Bombay Fusiliers who died of cholera at Karachi; also, on the same tablet, an inscription to Captain Rawlinson, Lieutenant A. P. Hunt, and 140 non-commissioned officers and privates who died before the return of the regiment to the Presidency; also, on the same tablet, an inscription to Lieutenant W. A. Anderson who was murdered at Multan, and to twenty-two non-commissioned officers and privates who were killed during the siege of Multan.

St. Patrick's Church (110).

ST. PATRICK'S CHURCH is a plastered stone building built by English soldiers at a cost of £1800 (Rs. 18,000) and blessed by the Right Reverend Bishop Hartmann in 1855. The cost was almost entirely borne by Catholic soldiers especially of Her Majesty's 64th 83rd and 86th Regiments, of, the Bombay Fusiliers, and of the Royal Artillery. The church has room for 700 people. The congregation consists chiefly of European soldiers

serving in the Poona garrison and their families, and the Native Christians of the native regiments. The church has a font enclosed in a wooden case and a harmonium.

St. Paul's Church (111).

ST. PAUL'S CHURCH, within suburban municipal limits about fifty yards south of the post-office, is a plain stone building with belfry and small windows. The inside is plain but it has four handsome stained-glass windows over the Communion Table. The church was built by Government after the style of the Sainte Chapell in Paris, from drawings by the Rev. Mr. Gell, B.A., and consecrated by Bishop Harding in 1867. It is intended for the use of the civil and military officers living in the Staff and Civil Lines and has 225 seats all of which are free. The north seats are kept for local residents and the south seats are open to all. The whole expenses of the church and worship are borne by the offerings of the congregation. The communion is celebrated every Sunday and at all other festivals. Morning prayer is said daily throughout the year, and during Advent and Lent special evening services are held,;

St. Xavier's Church (112).

ST. XAVIER'S CHURCH in Convent Street, Sadar Bazar, is a substantial stone building in the Gothic style built about 1865 at a cost of £1900 (Rs. 19,000). The entrances are sheltered by small Gothic arches. The nave measures 70' 6" by 30' 6" and the chancel 30' by 18' 6". The church has a steeple seventy-one feet high with two bells, a gallery at the west end 30' 6" by 15' for boys and singers with a harmonium, a small vestry 15' 13" off the chancel, a baptistry with font at the side entrance, three Gothic altars with statues from Munich, and a large stained glass window in the back wall of the sanctuary representing in panels scenes from the life of St. Francis Xavier. The church has room for about 500 people, the congregation consisting of about 400 European Eurasian and Portuguese clerks, tradesmen, and pensioners. The church has a regular morning and evening service and a double morning service on Sundays. Attached to the church is the Poona Convent orphanage and day school for girls under the Religious Nuns of Jesus and Mary. The building consists of three wings in two storeys joined by an angular tower and a separate day school. There are thirteen inmates, eighty boarders, fifty day scholars, and thirty native scholars. Opposite the convent is St. Vincent's school and parish house. The buildings of St. Vincent's include two dwellings and a large two-storeyed school-house built about 1867 at a cost of £4000 (Rs. 40,000), which included a Government contribution but was mostly provided by the Roman Catholic Bishop of Bombay. The school is managed by the Fathers of the Society of Jesus with lay teachers and has 260 pupils, European, Eurasians, Portuguese, Parsis, and a few Hindus and Musalmans.

Under St. Francis Xavier's church is a small chapel in the Camel Lines for a Madras Christian community of over 400. The chapel is a simple iron roofed brick building with room for about 200 people A service is held on Sundays. Attached to the chapel is a *Small* school with thirty boys and girls.

Synagogue (113).

The SYNAGOGUE, a handsome red-brick building with a lofty tower and spire, is in the south-east corner of suburban municipal limits, about 450 yards south of the post-office. It was built in 1867 by the late Mr. David Sassoon. It is a lofty church-like structure in the English-Gothic style, built of red brick with trap stone archwork and window mullions. The body of the interior is 62' by 44½ and 30' high to the planked ceiling with galleries on three sides supported on pillars which are carried through to the roof. At the west end is an apse at the end of which a curtain or veil hides the recess where the holy books are kept. The floor, which is of polished stone, is free from anything but a few chairs and movable seats. At about one-third of the length from the apse, and in front of it is a raised wooden platform surrounded by railings on which the officiating priests stand. The windows are in small panes of coloured glass. At the east end over the porch a red brick-tower 90' high carries a clock and bells and is surmounted by a spire.

Towers of Silence (114).

Among a few trees, on a low bare ridge called the Gul Tekdi, about half a mile south-east of Parvati hill, are two Parsi TOWERS OF SILENCE, about half a mile apart. Of the two towers one, enclosed by a wall, was built by Mr. Sorabji Ratanji Patel on the 29th of April 1825. Two fire-places or *sagris* are near this tower and a third is (July 1884) being built. The second tower was built by public subscription on the 28th of April 1835 at a cost of about £507 (Rs. 5070) and was enclosed by a wall in 1854. A road has lately been made between the public road leading to the slaughter house and the first Tower. There is no made road up the hill to the second Tower.

United Service Library(115).

The UNITED SERVICE LIBRARY is in the Native Infantry Lines to the north of St. Mary's church. It is a plain building with five rooms and a veranda all round. Of the five rooms two (75' by 25 and 25' by 14') are large and the other three are side rooms. The Library contains about 10,000 works and is especially rich in works on India. It takes twenty magazines and twenty-two newspapers seventeen English and five Anglo-Indian. It is open to officers of the Civil Military and Naval Services and in July 1884 had 145 subscribers and an income in 1883 of £491 (Rs. 4910) realised by subscriptions at the rate of £3 (Rs. 30) a year, £1 16s. (Rs. 18) a half year, £1 2s. (Rs. 11) a quarter, and 8s. (Rs. 4) a month. [The income of the library from January to June 1884 was Rs. 2424. The income for 1877 was Rs. 4394, for '878 Rs. 4033, for 1879 Rs. 3800, for 1880 Rs. 3634, for 1881 Rs. 4531, and for 1888 Rs. 4730.] In 1860 Poona had a library called the Poona Station Library owned by thirty-two shareholders. In July 1860 Sir W. Mansfield then commander-in-chief proposed to establish in Poona an institution similar to the Royal United Service Institution, London. The object of the new institution was 'the formation of a library containing historical scientific and professional works, maps, charts, and plans, the delivery of lectures, the collection of inventions and natural curiosities, and, if possible, the publication of a journal; the collection of native arms and a museum to serve as a central depository for objects of professional and general information and for trophies and relics connected with Indian history. The proposal found favour and the institution was called the United Service Institution of Western India. The shareholders of

the Poona Station Library handed over their building and library of about 2000 volumes as a nucleus, and the institution, whose funds were vested in trustees, became the property of the station. In 1867, after seven years' experience, the institution was not found to work well, and at a general meeting of subscribers, it was resolved to use the library only as a Reading Room and to change the name to the United Service Library Poona. The museum was sold by auction and a committee of seven was appointed to manage the library restricting it to the purposes of a Reading Room, the footing on which it noil works.[Professor G. W. Forrest.]

Vanavdi Barracks (116).

The VANAUDI BARRACKS, also known as the Right Flank Barrack from their situation to the right or south of the military cantonment, stand on high ground. Besides the sergeants and staff of a European regiment the barracks can accommodate 1006 rank and file. The barracks consist of double storeyed blocks arranged in open order, so that each block gets a share of the breeze. From time to time older buildings have been pulled down to make room for the present barracks. The buildings include eight older blocks completed in 1861 of brick and lime plastered, each to hold sixty men and two- sergeants. On each floor the blocks have a barrack room (109'by 25'and 18'high) and sergeants' quarters of two room each 12' by 13'. Both floors are surrounded by enclosed verandas eleven feet wide with windows glazed and venetianed. To these verandas the barrack rooms open on their longer sides by arched openings between pillars which carry the floor or roof above. Six other blocks were completed in 1872. They are two-storeyed of stone masonry surrounded on both floors by open verandas; the lower with masonry arches, the upper with posts. Each block contains on the ground floor and on the first floor two barrack rooms (87' by 24' and 18' high) with a sergeant's quarters between. The blocks were built according to the sanitary regulations and standard plans in force at the time. Except the older blocks, which have washrooms under the same roof as the barrack rooms, all have cook-rooms, washrooms, and latrines as outbuildings. There are eight staff sergeants' quarters and the patcheries or married men's quarters have room for eighty married men. The barracks include separate buildings for Guard-rooms, Cells, Hospital, Female Hospital, Medical Staff Quarters, Armourer's Shop, Workshop, Store, Canteen, Sergeants' Mess, and a Ball Court and a Skittle Alley. These quarters have from time to time been built or adapted from old ones according to standard plans and regulations in force at the time by successive Executive Engineers of Poona. The total cost of the barracks as they stand is £151,031 (Rs. 15,10,310).

Wellesly Bridge (117).

The WELLESLEY BRIDGE, -1. 14 miles west of the post office, crosses the Mutha river close above its meeting with the Mula. It replaces a wooden bridge which was built in 1830 and called the Wellesley bridge in honour of General Wellesley's conquest of Deccan in 1803. In 1870, as it had become unsafe and was too narrow for the traffic, the old bridge was pulled down and the present masonry bridge begun. It is a substantial stone structure of strong coursed masonry and consists of eight segmental arches of 52 ½ ' span, with a rise, of 13' and 2 ½ ' thickness of arch-ring, carrying a roadway, 28' wide at

a height of 47' above the deepest part of the river bed, protected on both sides by a neat dressed-stone parapet. It was designed by Lieutenant Colonel A. IT. H. Finch, R.E. Executive Engineer Poona, and built under his superintendence by Messrs. White and Company contractors; It was opened for traffic in 1873 at a cost of £11,092 (Rs. 1,10,920). A tablet on the bridge has the following inscription:

The original wooden structure, named in honour of the victories obtained in the Deccan by Major-Genl. Arthur Wellesley (afterwards F. M. the Duke of Wellington, K.G.), constructed by Captain Robert Foster, Bombay Engineers, at a cost of Rs.91,892, and opened in 1830 by the Honourable Major-General Sir John Malcolm, G. C. B., Governor of Bombay, having become decayed and unsafe for traffic, was removed, and the present bridge, designed and constructed by Colonel A. U. H. Finch, R-E., at a cost of Rs.110,932, was opened to the public in May 1875; His Excellency the Honourable Sir Philip Wodehouse, K. C. B., Governor and President in Council.

Yeravda Central jail (118),

The YERAVDA CENTRAL JAIL, Poona, intended for the confinement of long-term and dangerous prisoners, as well as for relieving the overcrowding of the several district jails throughout the Presidency, is situated three and a quarter miles north of the post office. The present structure, built altogether by convict labour under the supervision of the Public Works Department, was begun in 1866 and finished in 1880, previous to which, and whilst under construction, the prisoners were located in temporary barracks and tents. The outer wall, sixteen feet high and 1¼ miles all round, covers an area of fifty-nine acres. Within this enclosure are three circles or in fact jails on the radiating system, hospital, barracks, cook-house, dye-house, European jail, separate, solitary, and dark cells, store rooms and offices. The jail has accommodation for 1600 prisoners, and during the 1876-77 famine held over 1800, the workshops being then temporarily turned into dormitories.

At the end of 1883, 911 prisoners were confined in the jail, the average daily number during the year being 1016 and the average yearly cost of each prisoner being £6 6s. (Rs. 63). The prisoners are employed extramurally on the several gardens in connection with the jail, and hired out to contractors for unskilled labour, and intramurally on the various industries carried on in the factory, chiefly carpet-making, coir-work, cane-work, carpentry, french polishing, and printing. The factory work is well known for its superior quality throughout India and also in Europe and America.

The officer in charge is styled the Superintendent, but performs also the duties of a medical officer, the appointment being now invariably held by a medical man who enjoys a monthly salary of £70 (Rs.700) rising to £95 (Rs. 950). The jail establishment consists of a jailor, a deputy jailor, three European warders, one steward, two clerks, two hospital assistants, and sixty-four warders or peons, the yearly cost of all, exclusive of Superintendent, being £2040 (Rs. 20,400). In addition to the above establishment a military guard, consisting of one jamadar and thirty-four rank and file, is always present at the jail to assist in quelling emeutes.

A school, inspected yearly by the educational department, is kept at the jail, one or two educated men amongst the convicts being appointed teachers. Urdu, Marathi, and Kanarese and elementary exercises in arithmetic are taught. The Poona Meteorological Observatory is situated at Yeravda in charge of the Superintendent of the jail. The jail establishment, inclusive of the Superintendent, reside in quarters near the jail, the Europeans on the south or front side, and the natives on the north or rear of the jail.

POONA:

History.

The name Poona, as its Sanskrit form Punyapur or Cleanser shows, probably refers to the holy meeting of the Mutha and the Mula close to which it is built. Its religious position, and its trade position on one of the main approaches to the Bor pass, mark Poona as likely to be an early settlement. The earliest known remains in the neighbourhood are the Shaiv cave at Bhamburda about one mile and the cells in the Ganesh khind hills about two miles to the north-west of the city. The Ganeshkhind cells are plain and small and of uncertain age; the Bhamburda cave is believed to belong to the seventh or eighth century. [Lord Valentia's (1803) collection of poona agates (Travels, 11.113) and the number of agates and chalcedonies which may still lie found near (Ganeshkhind suggest that poona may be Ptolemy's (A.D. 150) Pumiata in which are beryls so known Perhaps to distinguish it from the other Punnata or Punnatu which Mr. Rice has discovered in the Maisur State (Ind, Ant, XII. 13; Sewell's Southern India dynasties, 86). It is worthy of note that poona appears as Panatu, almost the same as in Ptolemy, in the map of the arccarate English traveller Fryer (1673 -1675), the 't' in both cases seems to represent the nasal 'e' which survives in a weaker form in the spelling poone] According to local tradition in A. D. 613 (*Shak* 535) Poona was a hamlet of about fifteen huts two of Brahmans and the rest of fishermen and musicians. At each corner to ward off evil were the temples of Bahiroba, Maruti, Narayaneshvar and Puneshvar, and a Mhasoba, of which the Mhasoba and the Maruti. and an old temple of Puneshvar, now the shrine of the younger Shaikh Sala, remain. To the east of Poona were (A. D). (613) two small villages' Kasarli and Kumbharli which have been absorbed in the city. [As ass stone or *gadhar dagav* which still remains is said to mark the herders of the three hamlets. A proof that poona includes three separate villages remains in the fact that there are three families of grant-enjoying Mhars. Of the three '*chavdis* village offices and three Bahirobas or village guardians two *chavdis* and two Bahirobas remain.] In A.D. (1290) (*Shak* 1212) Poona seems to have been taken by the troops of Ala-ud-din the Khilji emperor of Delhi (1295-1315). The memory of the Musalman conquest survives in a local story that Hisa Mohidin and four other Musalman ascetics came to the hamlet and turned the two temples of Puneshvar and Narayaneshvar into the two Musalman Shrines or *dargahs* (31) of the elder and the younger Shaikh Sallas. [These shrines are described above pp. 343-344. They have still many traces of their Hindu origin.] Under the Mussulmans, according to local tradition, an Arab officer and a small force were stationed at Poona. Barya the Arab commandant fortified the town or *kasba* by a bastioned mud wall with three large gates, the Kumbharves on the north, the Kedarves on the east, and the

Mavalves on the west. The ruins of this wall, now called Pandhricha Kot, remain and the part, of the city within its limits goes by the name of Juna Kot (24). It is said that only the garrison and the Musalman inhabitants lived within the wall. The hereditary or *sthaik* and the casual or *upri* Hindu land-holders traders and Brahmans lived outside of the walls. Poona prospered and grew. Four new wards or *peths* were added, two to the south Mohiyabad now called Budhvar and Malkapur now called Aditvar, one to the east Astapura now called Mangalvar and one to the west Murchudabad now called Shanvar. In 1595 king Bahadur Nizam II. (1596-1599) ennobled a Maratha named Maloji Bhonsla the grandfather of Shivaji the Great and gave him the estates of Poona and Supa with the forts and districts of Shivner and Chakan. In 1620 the town suffered much from the exactions of Siddhi Yakutray the Poona commandant of the Ahmadnagar minister Malik Ambar (1607-1626). Many people left and a few years later (1629-1630)[This was the 1629-30 famine. Compare Elphinstone's History, 507; Elliot and Dowson, VII. 24-25.] the town was for three years wasted by famine. In 1630 Murar Jagdevrav, the minister of Mahmud the seventh Bijapur king (1626- 1656), while engaged in the pursuit of Shahaji, burnt Poona, threw down the walls, passed an ass-drawn plough along the foundations, and fixed in the ground an iron rod as a sign that the place was accursed and desolate. The effect of the curse did not last long. In 1635 the same Mahmud of Bijapur, on the occasion of his entering the Bijapur service, confirmed Shahaji Bhonsla the son of Maloji Bhonsla and the father of Shivaji in his father's estates of Poona and Supa. Shahaji made Poona the headquarters of his territory and appointed a Deccan Brahman named Dadaji Kondadev to manage it from Poona. Under Dadaji the place flourished. The land rents were lowered and the unsettled hill people were employed as guards and messengers and to destroy the wolves by which the country round Poona was then overrun. [East India Papers, IV. 420.] Dadaji appointed one Malthankar to be commandant of Poona. To remove Murar Jagdevrav's curse (1630) Malthankar pulled out the iron rod, passed a golden plough along the line of the fortifications, held a *shanti* or peace-making to drive away the evil spirits, and rebuilt the wall. [N. V. Joshi's Marathi Account of Poona, 8.] Settlers were granted land free of rent for five years and with only a *tankha* rent in the sixth year. At the same time on the southern limit of the town Dadaji built a large mansion called the Lai Mahal (1)[The Lal Mahal now called Ambarkhana (1) as the Peshwa's elephant canopies or *ambaris* were kept there, is still in repair. See above p. 331.] or Red Palace for Shahaji's wife Jijibai and her son Shivaji. Jijibai also built the temple of Ganpati which is now called the Kasba Ganpati (12). In 1647 Dadaji Kondadev died and Shivaji took charge of his father's Poona estates, including the city. In 1662, to punish raids on Moghal territory close to Aurangabad, Shaiste Khan the Moghal governor advanced from Aurangabad with a great force towards Poona and Chakan, and Shivaji, who was in Supa, retired to Sinhgad; Supa fell, and in spite of much annoyance from Shivaji's horse, the Musalmans pressed on and took Poona.[Elliot and Dowson, VII. 261-262.] Shaiste Khan took Chakan fort, eighteen miles north of Poona, and several other Poona strongholds, and in 1663 came to live in Poona in the Lal Mahal, Shivaji's home. [Shaiste Khan settled the Shaistepura Peth now called Mangalvar Peth, See above p. 274.] In spite of the precautions which had been taken to prevent armed Marathas entering Poona Shivaji determined to surprise the Moghals. He sent two Brahmans in advance to make preparations. One evening in April a little before sunset Shivaji set out from Sinhgad with a considerable body of foot soldiers. These he posted in small parties

along the road and took with him to Poona two of his most trusted men Tanaji Malusre and Yesaji Kank and fifteen Mavlis. The Brahmans had won over some Marathas in Shaiste Khan's employ who arranged that two parties of Marathas should enter the town one as if a wedding party the other as if bringing prisoners, and that Shivaji and his twenty-five should pass in with them. Shivaji's party passed safely, put on their armour, and, at the dead of night, by secret ways reached Shaiste Khan's house which Shivaji well knew. They entered through the cook-house, killed the cooks, and as they were cutting through a built-up window, the alarm was raised. Three of the Mavlis forced themselves into Shaiste Khan's room, but two fell into a cistern of water and the third, though he cut off Shaiste Khan's thumb, was, killed by his spear. Two slave girls dragged Shaiste Khan to a place of safety. [This is Khafi Khan's account in Elliot and Dowson, VII. 270-271. According to Grant Duff (Marathas, 88) Shaiste Khan's fingers were cut off as he was letting himself out of a window.] The Marathas killed many of his followers, cut to pieces some of the women, and cut off the head of an old man whom they took for Shaiste Khan. The kettledrums beat an alarm and the Marathas retired, lighting torches and burning bonfires as they went up Sinhgad in derision of the Moghals. [Elliot and Dowson, VII. 270-271.] Later in the same year Shivaji came to Poona to hear a *katha* or song sermon by the Vani saint Tukaram and narrowly escaped being taken prisoner by the garrison of Chakan. [Grant Duff's Marathas, 89. According to the Marathas, Shivaji escaped by the help of Vithoba of Pandharpur.] In 1662, Shahaji came to Poona to visit Shivaji, who was then thirty-five years old and in great power. Shivaji omitted no means of showing his father respect, He walked several miles before his palanquin, attended him as a servant, and refused to be seated in his presence. [Grant Duff's Marathas, 85.] In 1665 the new Moghal viceroy Jaysing came to Poona, arranged its affairs, and spread his forces over the country.[Grant Duff's Marathas, 92.] In 1667, after his famous escape from Delhi, Shivaji obtained from Aurangzeb the title of Raja, and Poona Chakan and Supa were restored to him. [Grant Duff's Marathas, 98,99.] In 1674 the transfer of Shivaji's head-quarters to Raygad hill in Kolaba reduced the importance of Poona. About 1675 Poona appears as Panatu in Fryer's map. [New Account, 50,] In 1679 Poona was in charge of Naro Shankar Sachiv one of Shivaji's eight ministers. [Marathi Account, 14.] Shivaji died in 1680. In 1685 Aurangzeb sent a noble named Kakad Khan to Poona who is remembered as having introduced the unpopular order of obliging the people to recognize Golak or bastard Brahmans as family priests or *upadhyas*. The town people in despair are said to have appealed to the gods but the gods upheld Kakad Khan and the bastards. [Marathi Account, 14.] In 1688, according to local tradition, Aurangzeb, finding that the Musalman wards were deserted and overgrown with trees, sent one Mohanlal to resettle the town. Mohanlal died while attempting to restore the town and Aurangzeb in his honour called the town Mohiyabad. About 1703 Aurangzeb encamped with his army for a month in a jujube or *bor* grove [The jujube grove was on the site of the present Bhavani ward.] south of Poona and settled a new ward called Mohiyabad near the grave of Mohanlal. [Marathi Account, 15. According to Khafi Khan (Elliot and Dowson, VII. 373) the Peth was called after Muhiu-1-Mulk the grandson of Alirangzeb who died at Poona.] In 1707 Lodikhan, commandant of Poona, was defeated by Dhanaji Jadhav the general of Tarabai the aunt of Shahu. [Grant Duff's Marathas, 185.] In 1708 Shahu was established at Satara, while Poona remained under the Moghals, Shahu claiming the *chauth* and *sardeshmukhi* rights over it. Shahu's representative at Poona was Balaji

Vishvanath, afterwards the first Peshwa, and the Moghal officer was a Maratha named Rambhaji Nimbalkar. Under this double government, which lasted till 1720, Poona suffered severely and the city was once plundered by the Nimbalkar's orders. [Marathi Account, 16, See Part II. p. 241.] In 1720 the double government ceased as, under the Delhi home-rule grant, Poona became one of Shahu's sixteen *svarajya* districts. In 1721 Balaji died and was succeeded as Peshwa by his son Bajirav, who appointed one Bapuji Shripat to be manager or *subhedar* of Poona. Bapuji persuaded many merchants to settle in Poona. [Marathi Account, 18.] In 1728 the old city wall on the river bank was pulled down and sites for mansions allowed to the Purandhare and Chitnis families, and, between 1729 and 1736, the Shanvar palace (32) was built near the Mavalves. In 1731 Bajirav remained at Poona and employed himself in improving the internal management of Maratha affairs. He continued at Poona Dabhade Senapati's practice of feeding some thousands of Brahmans for several days. He also gave sums of money to the assembled religious doctors styled Shastris and Vaidiks. The festival was continued by his successors and was known by the name of *dakshina* or money gifts. [Grant Duff's Marathas, 225. Details are given above pp. 48, 62-64.] Of minor city works belonging to the time of Bajirav Peshwa (1720-1740) the chief are the temple of Omkareshvar (23) begun at his private expense by Bajirav's brother Chimnaji Appa, the temple of Amriteshvar (2) built by his sister Bhiubai, and a pigeon house.

1739.

In 1739 Captain Gordon, a British envoy to Satara, perhaps the first European who visited Poona, found the districts round Poona flourishing. The rent of land was low and husbandmen were drawn from other parts of the country. In and near Poona were many signs of prosperity. The crowded streets were lined with handsome houses. In a large foundry was the form of a thirteeninch mortar and considerable progress had been made in the art of running iron for shot and casting shell small cohorns and great guns. Weavers were encouraged and the produce of the Poona looms was sent to various parts of India and in large quantities to Bombay. Poona was emphatically the city of the Peshwas, rising with them and growing with their growth. [Bombay Quarterly Review, IV. 95.] In 1740 Bajirav was succeeded by his son Balaji (1740-1761). In 1741, on the death of his uncle Chimnaji, Balaji spent nearly a year in improving the civil administration of Poona. From this till 1745, a period of unusual quiet, Balaji caused marked improvement in the country. [Grant Duffs Marathas, 264.] In 1749 Shahu the Raja of Satara died. Before his death Balaji had obtained a deed empowering him to manage the Maratha empire. In 1750 he came to Poona which was now the capital of the Maratha empire. [Grant Duffs Marathas, '270.] About this time the French missionary Tieffenthaler describes Poona as the capital of a Maratha prince of the Brahman caste. The town was well peopled and the houses were built partly of brick and partly of mud. The head of the government lived in a fortress surrounded by walls. [Description Historique et Geographique, I. 484.] In 1751 as Damaji Gaikwar refused to comply with Balaji's demands he was surrounded and made prisoner and kept in confinement in Poona city till 1754. [Grant Duffs Marathas, 274] In 1756 Mr. John Spencer and Mr. Thomas Byfield, members of the Bombay Council, came to Poona and had a long interview with Balaji Peshwa. [Grant Duff's Marathas, 294-295.] In 1757 Anquetil Du Perron, the

French scholar and traveller, mentions Poona as the union of four or five villages in a plain with a common market and some one-storeyed houses. It was strictly a great camp of huts and was the actual capital of the Marathas and fairly prosperous. The market a broad street crossed the town from end to end. In it were all the merchandise of Asia and part of the goods of Europe which the English sent from Bombay four or five days distant. The riches were used by the Musalmans rather than by the Marathas. The Marathas had few wants. A piece of red cloth for the head, another white cloth for the waist, a third as a scarf, and some yards of cloth for winter. This was the dress of the richest. Their usual food was rice and pulse mixed with butter. If the Marathas were all-powerful European trade with India would perish. But the softness and luxury of the Moors more than makes up for the bare frugality of the Marathas. In the market were many run away Europeans. In many of the streets there was not one house worthy of notice and much stabling and forage. [Zend A vesta, 1. ccxxvii. ccxxix.] In 1761 Balaji Peshwa died at Parvat in Poona crushed by the ruin of Pauipat. [Grant Duff's Marathas, 320.] In Balaji's reign the Parvati lake was made, the city walls were begun, and the temples of Nageshvarav and Tulsibag were finished. [Marathi Description, 34-42.] In 1763 Nizam Ali of Haidarabad plundered Poona taking much property and destroying and burning all houses which were not ransomed. [Grant Duff's Marathas, 328; Eastwick's Kaisarnama, 70; wilks' South of india,] In 1763 Peshwa Madhavrav (1761-1772) assembled a large army at Poona to act against Haidar Ali of Maisur (1763 - 1782). [Grant Duff's Marathas, 330,] In 1768 Mr. Mostyn came to Poona as envoy from the Bombay Government to try and secure an assurance that the Peshwa should not join in alliance with Haidar and the Nizam, but Madhavrav refused to give the assurance and told Mr. Mostyn that he would be guided by circumstances. [See Part II. p. 253.]

In 1768 Madhavrav surprised Raghunathrav's army near Dhodap in Nasik and confined him in Poona in the Peshwa's palace. [Grant Duff's Marathas, 340.] In 1769 Janoji Bhonsla of Berar who supported Raghunathrav began to plunder the country on the way to Poona. After Poona was, destroyed by Nizam Ali in 1763 Madhavrav proposed to surround it with a wall. This design was abandoned on the ground that no fortified plain city could ever be as safe as Sinhgad and Purandhar. On Janoji's approach the people of Poona sent off their property, and as no steps were taken to stop the plundering Madhavrav was forced to make a treaty with Janoji. [Grant Duff's Marathas, 341 -342.] In 1772 the Court of Directors ordered that a resident envoy should be appointed at Poona and Mr. Mostyn came to live in Poona as British envoy. [Grant Duff's Marathas, 371.] Madhavrav Peshwa died on the 18th of Nov. 1772 and was succeeded early in December by his younger brother Narayanrav who was murdered on the 30th of Aug. 1773. That morning a commotion broke out among the Peshwa's regular infantry at Poona. Towards noon the disturbance so greatly increased that, before going to dine, Narayanrav told Haripant Phadke to restore order. Haripant neglected his instructions, and in the afternoon Narayanrav, who had retired to rest, was awakened by a tumult in the palace where a large body of infantry, led by two men named Sumersing and Muhammad Yusuf, were demanding arrears of pay. Kharaksing, who commanded the palace guard, joined the rioters. Instead of entering by the open main gate, they made their way through an unfinished door on the east, which, together with the wall round the palace, had shortly before been pulled down to make an entrance distinct from the

entrance to Raghunathrav's quarters. On starting from sleep Narayanrav, closely pursued by Sumersing, ran to his uncle's room. He threw himself into his uncle's arms, and called on him to save him. Raghunathrav begged Sumersing to spare his life. 'I have not gone thus far to ensure my own destruction' replied Sumersing; 'let him go, or you shall die with him.' Raghunathrav disengaged himself and got out on the terrace. Narayanrav attempted to follow him, but Tralia Povar, an armed Maratha servant of Raghunathrav's, seized him by the leg and pulled him down. As Narayanrav fell, Chapaji Tilekar, one of his own servants came in, and though unarmed rushed to his master. Narayanrav clasped his arms round Chapaji's neck, and Sumersing and Tralia slew them both with their swords. Meanwhile the conspirators secured the whole of the outer wall of the palace. The tumult passed to the city, armed men thronged the streets, the shops were shut, and the townsmen ran to and fro in consternation. Sakharam Bapu went to the police superintendent's office and there heard that Raghunathrav had sent assurances to the people that all was quiet. Sakharam Bapu directed Haripant Phadke to write a note to Raghunathrav.

Raghunathrav answered telling him that some soldiers had murdered his nephew. Haripant declared that Raghunathrav was the murderer and fled to Baramati. Sakharam Bapu told the people to go to their homes and that no one would harm them. On that night Bajaba Purandhare and Maloji Ghorpade had an interview with Raghunathrav, and Trimbakrav Mama bore off Narayanrav's body and burnt it. Visitors were received at the palace. Mr. Mostyn the English envoy, and the different agents, paid their respects, but Raghunathrav remained in confinement, detained, as was said, by the conspirators, as a security for the payment of their arrears. Raghunathrav was suspected, but there was no proof. He was known to have loved his nephew, and the ministers decided that until the contrary was proved, Raghunathrav should be held innocent and be accepted as the new Peshwa. Ram Shastri approved of this decision. At the same time he made close inquiries. After about six weeks he found a paper from Raghunathrav to Sumersing, giving him authority to slay Narayanrav. Ram Shastri showed this paper to Raghunathrav, who admitted that he had given an order, but persisted that his order was to seize Narayanrav, not to slay him. Examination of the paper confirmed Raghunathrav's statement showing that the word *dharave* seize had been changed to *marave* kill. This change, it was generally believed, was the work of Anandibai Raghunathrav's wife. It was also believed that it was under her orders that the servant Tralia Povar had taken part in Narayanrav's murder. When Raghunathrav confessed his share in Narayanrav's murder, he asked Ram Shastri what atonement he could make. 'The sacrifice of your life,' boldly replied the Shastri, 'is the only atonement.' The Shastri refused to stay in Poona if Raghunathrav was at the head of affairs, left the city, and spent the rest of his life in retirement near Wai. Meanwhile the arrears of pay were discharged, Raghunathrav was released, and his adopted son Amritrav, attended by Bajaba Purandhare was sent to Satara to bring the robes of office. Raghunathrav was proclaimed Peshwa. Haidar Ali of Maisur and Nizam Ali of Haidarabad lost little time in taking advantage of the disturbances at Poona. [Grant Duff's Marathas, 363.] Raghunathrav left Poona resolved to oppose Nizam Ali and cripple his power. Meanwhile the Poona ministers sent Gangabai the pregnant wife of Narayanrav to Purandhar and began to govern in her name. Negotiations were opened with Nizam Ali and Sabaji Bhonsla both of whom agreed to

support Gangabai, and a wide spread intrigue in Raghunathrav's camp was organised. When Raghunathrav heard of the revolt in Poona, he began to march towards the city. Haripant Phadke came from Poona to meet him the head of a division. On the 4th of March 1774 Raghunathrav met and defeated the ministers' troops near Pandharpur under Trimbakrav Mama. The news of this defeat filled Poona with alarm. The people packed their property and fled for safety to the villages and hill forts. [Grant Duff's Marathas, 367-368.] In 1776 the impostor Sadoba, who gave himself out as Sadashiv Chimnaji who had died at Panipat, was carried by Angria a prisoner to Poona, where he was bound to the foot of an elephant and trample to death. [Grant Duff's Marathas, 397 -398] In 1777 an agent of France was received at Poona with distinction, and the British envoy Mr. Mostyn was treated with studied coldness. In March 1777 several Frenchmen went by Cheul to Poona and early in May 1777 one of them St. Lubin was received in Poona as an ambassador from France. [Grant Duff's Marathas, 404. Grant Duff quotes an interesting letter regarding St. Lubin written from poona by Mr. Farmer of the Bombay Civil Service, 405 note 2.] In 1781 on the approach of General Goddard Poona houses were filled with straw and preparations made for taking the people to Satara. [Pennant's Views of Hindustan, 1.95.] In 1785 at Nana Fadnavis' desire Mr. Charles Malet was chosen to be British resident at Poona. [Grant Duff's Marathas, 468.] About this time Major Rennell describes Poona as meanly built, not large and defenceless. In case of invasion the officers retired to Purandhar eighteen miles to the south-east where the Government records, were kept and where many of the chief officers usually lived. This arrangement in Rennell's opinion greatly added to the strength of the Peshwa as he was free from the encumbrance of a great capital. [Memoir, 134.] On the 1 st of June 1790 a treaty was concluded at Poona for the suppression of Tipu between Mr. Malet on the part of the Company and Nana Fadnavis on the part of the Peshwa and Nizam Ali. [Grant Duff's Marathas, 484.] In August 1791 there was a curious outbreak of lawlessness at Poona. A party of merry Brahmans had separated rather late at night. Thirty-four of them remaining in the streets after the firing of the Bhamburda gun, [The Bhamburda gun was always fired at nine. It was a gun of large calibre and gave sufficient warning to all people to retire to their homes. After a reasonable time, the patrols took up and imprisoned very individual in the streets and took him before the city police superintendent or *kotval*. A story is told of a Peshwa having been thus taken up by the patrol. Sometimes the firing of the gun was delayed half an hour and sometimes an hour or more. Moor's Hindu Pantheon, 373.] were taken up by the police and placed in confinement. In the morning twenty-one of them were found dead and the rest scarcely alive. The popular clamour grew great against the police superintendent or *kotval* one Ghashiram, a Kanoja Brahman of Aurangabad whom Nana Fadnavis had raised at the cost of his daughter's honour. Though Ghashiram did not even know of their imprisonment until the morning when the catastrophe occurred, popular indignation rose to such a pitch that Ghashiram sought refuge in the Peshwa's palace. The Peshwa, yielding to his fears, gave up the unhappy man to the mob, headed by a number of Telang Brahmans the caste to which the sufferers belonged. Ghashiram was dragged with every species of indignity to his own mansion and reservoir, he was bound with a cord held, by a Mhar, and he was stoned to death by the Telang Brahmans. [Moor's Hindu Pantheon, 373; Grant Duffs Marathas, 550. Other accounts seem to show that Ghashiram had grossly misused his power and deserved his fate.]

In 1792 Captain Moor describes the neighbourhood of Poona as well watered by frequent streamlets (June 3-8) and adorned by groves and gardens of which the cypress was the chief ornament, the city was not very large, not covering more than two miles. It was fairly but neither elegantly nor handsomely built. The Peshwa's palace was handsome but hardly grand enough for a royal residence. Other houses were more elegant. There were large markets and a long street of English looking-glasses, globe-lamps, and other finery. In the Peshwa's foundries thirty-six to forty-two pounder guns were made. The police was said to be particularly efficient. On the north-west a bridge had been begun across the Mutha. But as two Peshwas who were interested in the work died it was stopped as unlucky. There was a wooden bridge further up in bad repair. [Narrative, 78,363-365.]. Sir Charles Malet's residence at the Sangam was one of the pleasantest in India. He had formerly lived in the city but was allowed to move to the point above the meeting of the Mutha and the Mula. When he came this spot was bare except a ruined temple. He and his staff at great expense built neat houses and had a beautiful garden watered from both rivers by aqueducts. It yielded all the country fruits, and excellent vines, and had thirty apple and peach trees which promised to be a great addition to the fruits of the Deccan. He had a stud of forty or fifty noble Persian and Arab horses and several elephants [Narrative, 363-364].

In this year (1792) Poona witnessed the grand display of the Peshwa being robed as agent of the Emperor of Delhi. Mahadji Sindia, who was supreme at the Delhi court, came to Poona on the 11th of June with the deeds and robes of the hereditary office of *Vakil-i-Mutlak* or chief minister, whose hereditary deputy in North India was to be Sindia. Sindia pitched his camp near the Sangam, the place assigned by the Peshwa for the residence of the British envoy and his suite. Nana Fadnavis, who was jealous of Sindia, did all he could to prevent the Peshwa from accepting the titles and insignia brought from the Emperor. But Sindia persisted and the Raja of Satara gave the Peshwa formal leave to accept the honours. On the 21st Sindia paid his respects to the Peshwa, carrying with him numberless rarities from North India. The following morning was fixed for the ceremony of investing the young prince with the title and dignity of *Vakil-i-Mutlak*, and Sindia spared no pains to make the investiture imposing. Poona had never seen so grand a display. A large suite of tents was pitched at a distance from Sindia's camp and the Peshwa proceeded towards them with the grandest display. At the further end of the tents a throne, meant to represent the Delhi throne, was raised and on it were displayed the imperial decree or *farman*, the *khilat* or the dress of investiture, and all the chief insignia. On approaching the throne the Peshwa made his obeisance thrice, placed 101 gold *mohars* as an offering or *nasar*, and took his seat on the left of the throne. Sindia's Persian secretary then read the imperial *farmans*, and among others, an edict forbidding the slaughter of bullocks and cows. The Peshwa then received the *khilat*, consisting of nine articles of dress, five superb ornaments of jewels and feathers, a sword and shield, a pen case, a seal and inkstand, and two royal fans of peacock's tails or *morchals* with a *nalki*, [A *nalki* is a sedan chair without a top and having four poles two behind and two before, never used but by emperors or persons of the highest rank.] a *palkhi*, [A *palkhi* is an open bedstead with a curved pole over it.] a horse and an elephant with six other elephants bearing the imperial standard, two crescents two stars, and the orders of the fish and of the sun. The Peshwa retired to an adjoining tent and returned clothed in the

imperial robes when he resumed his seat; and Sindia and Nana Fadnavis and other officers of the Peshwa offered *nazars* of congratulation. When the Peshwa rose to return to the palace, Sindia and Phadke followed carrying the peacock fans and fanning him. He entered Poona seated in the *nalki*; the throng of people assembled to see the procession was very great; the pomp and grandeur displayed was beyond anything the people of Poona had seen, while the clang of thousands of musical instruments, the shouts of the populace, the volleys of musketry and salvos of cannon gave to the ceremony all the effect that Sindia desired. [Grant Duff's Marathas, 499 - 500.] Two years later (February 12th, 1794) Mahadji Sindia, after a sudden illness of three days, died at Vanavdi. His body was burned and over the ashes was built a tomb still known as Sindia's Chhatra (103). In 1795 Madhavrao the young Peshwa was upbraided by Nana Fadnavis for keeping a private correspondence with his cousin Bajirao, afterwards the last Peshwa who was then confined in Junnar. Overwhelmed with anger and grief he for days refused to leave his room. At the *Dasara* on the 22nd of October he appeared among his troops and in the evening received chiefs and ambassadors. But his spirit was wounded to despair, a fixed melancholy seized his mind, and on the morning of the 25th of October, he threw himself from a terrace in his palace, fractured two of his limbs, and was much wounded by the jet of a fountain on which he fell. He lived two days and died having particularly desired that Bajirao should succeed him. [Grant Duff's Marathas, 521.] On the 26th of May 1796, much against his will, Chimnaji the second son of Raghunathrao and brother of Bajirao was adopted by the widow of the late Peshwa and formally installed as Peshwa. [Grant Duff's Marathas, 524.] On the 4th of December of the same year Bajirao was installed as Peshwa Chimnaji's adoption being declared illegal. [Grant Duff's Marathas, 529.]

In the beginning of 1797 a desperate affray took place in the streets of Poona between a body of Arabs and a party of Maratha soldiers in which upwards of 100 persons were killed and many shops and houses were plundered. [Grant Duff's Marathas, 530.] On the 31st of December Nana Fadnavis, while returning a formal visit to Sindia, was seized by Michel Filoze a Neapolitan officer of Sindia's. On his word of honour Filoze had guaranteed Nana's return and his perfidy excited great indignation. Several persons of distinction who went with Nana were also seized and the rest of his retinue of about 1000 men were stripped, maimed, some of them killed, and the whole dispersed. Parties of soldiers were sent to plunder not only Nana's house but the houses of all his adherents, many of whom barricaded their doors and defended themselves from the roofs and windows. The city was as if taken by storm and firing continued the whole night and next day. The roads were stopped on every side; all was uproar, plunder, and bloodshed; the alarm was universal; friends marched together in groups with their shields on their arms and their swords in their hands. [Grant Duff's Marathas, 532.] In 1798, with the consent of Bajirao and Sindia, Sindia's Divan and father-in-law Sarjerao Ghatge so ferociously plundered Poona, that his name is still remembered with horror. Ghatge's first step was to raise money from the members of Nana's party who were confined in Bajirao's palace. These men of position and high reputation were dragged out and scourged till they gave up their property. One of them, a relation of Nana's, died tied to a heated gun. These cruelties were not confined to Nana's friends. Merchants, bankers, and all in the city who were supposed to have wealth were seized and tortured with such cruelty that several of

them died. Though the plan of levying money from the people of Poona was Bajirav's, he never supposed that the money would be collected with such cruelty. Bajirav remonstrated with Sindia but to no purpose. [Grant Duff's, *Marathas*, 533.] In the same year the Peshwa's troops, which were greatly in arrears, raised a tumult and kicked about the street the turban of one of Bajirav's favourites who tried to interfere. The tumult was quelled by Naropant the former commandant a friend of Nana's. This was followed in 1798 by a war between the widows of Mahadji Sindia who were living in Poona camp. Though Daulatrav Sindia, the nephew of Mahadji, had promised to make ample provision for them they found no provision made and even their comforts scrimped. The youngest widow was a beautiful woman and the others discovered or invented a criminal intimacy between her and Sindia. The ladies openly accused Sindia of incest and Ghatge, who was sent to quiet their complaints, being refused an entrance, forced his way into their tents and seized and flogged them. The Shenvi Brahmans, who, before Ghatge's rise to power, were the strongest party in Sindia's army, took the side of the widows and it was arranged that they should be sent to Burhanpur. [Grant Duff's *Marathas*, 538.] On their way to Burhanpur their friends learned that the widows were being taken not to Burhanpur but to Ahmadnagar fort. Under the influence of Shenvi officers a Pathan named Muzaffar Khan, who was in command of a choice body of cavalry, assailed the escort near Koregaon, afterwards the scene of Staunton's celebrated battle, rescued the widows, and carried them back close to Sindia's camp. Ghatge persuaded Sindia to let him attack Muzaffar. Muzaffar had warning and retired with the widows pursued by Ghatge. He left the ladies in the camp of Amritrav, Bajirav's brother who was near the Bhima, turned on Ghatge, defeated him, and put him to flight. Bajirav, who is said to have instigated the whole, approved of his brother's kindness to the widows and asked Colonel Palmer the British resident to mediate between them and Sindia. Sindia refused and on the night of the 7th of June sent Ghatge with five battalions of regular infantry under Du Prat a Frenchman, to surprise Amritrav's camp and seize the ladies. Ghatge's attempt failed and he had to retire with loss. Sindia then promised to arrange for a suitable establishment for the ladies, and Amritrav came into Poona and camped close to Sindia. It was the Muharram time, and Ghatge under pretence of keeping order brought two brigades of infantry and twenty-five guns close to Amritrav's camp, suddenly opened fire on it, charged and dispersed Amritrav's troops, and pillaged his camp. This outrage was nothing less than an attack on the Peshwa himself. Holkar came and sided with the Peshwa, the other Maratha nobles joined his standard, and the Peshwa negotiated an alliance with Niizam Ali. Sindia was alarmed by the treaty and brought Nana Fadnavis from Ahmadnagar and proposed to put him at the head of affairs. Meanwhile Ghatge had been acting with such cruelty that Sindia felt that Ghatge's disgraceful acts were alienating the minds of all his supporters. He accordingly gave orders for Ghatge's arrest which was successfully effected. Ghatge's arrest reconciled Sindia and Bajirav. In 1799 Sindia's widows fled to Kolhapur with the Shenvi Brahmans from Sindia's camp. Large bodies of horse flocked with them and when sufficiently strong they returned to the northward and not only insulted Sindia in his lines but stopped the roads near Poona. The country was wasted by swarms of horsemen. [Grant Duff's *Marathas*, 545.] Early in 1800 Nana Fadnavis died at Poona. This event sealed the fate of the Peshwa's government. Before the close of the year Yashwantrav Holkar obliged India to leave Poona, but before he left Poona Sindia forced Bajirav to give him bills worth £470,000 (47 lakhs). After Sindia left Poona Bajirav began to

distress and pillage all who had opposed himself or his father. One of the first who suffered was Madhavrav Rastia, whom he invited to visit him, and whom he seized and hurried to prison. This act followed by others like it caused great discontent in the city. Lawlessness spread and the country was filled by bands of plundering horsemen. Among the prisoners taken in one affray was vithoji the brother of Yashvantrav Holkar, whom Bajirav ordered to be tied to an elephant's foot and dragged in the streets of Poona (April 1801).

Colonel Welsh, 1801.

About this time Colonel Welsh describes Poona as about three miles long and two broad with 140,000 houses and 600,000 people. The streets were extremely narrow and full of markets with innumerable articles of merchandise, the produce of India China and Europe. The houses some three or four storeys high were built without much regard to taste or symmetry though being diversified in size shape and colour they had a pretty appearance from a distance. The view from the opposite side of the river was most imposing, as that part of the town which was washed by the stream, being faced with stone descending in many parts by regular steps to the water's edge and having trees intermingled with the houses, presented an appearance very far from despicable, though a stranger set down in the streets could hardly credit the assertion. The fruit markets were well supplied with musk and water melons, plantains, figs, dates, raisins, mangoes, pomegranates, woodapples, almonds, and a great variety of country vegetables. In short it appeared a place of great wealth in which centred the entire trade of the empire. [Welsh quoted in Maxwell's Life of Wellington (1839), L 122.] Of Poona at this time and during the reign of Bajirav, Captain Robertson the first Collector wrote in 1825. Poona was then a gay rich and busy city. The wealthy governors and revenue officers of Gujarat and Karnatak, wherever they made their money, spent it in Poona on marriages, feasts, and a numerous retinue of Maratha servants and dependants. Vast wealth flowed into Poona from other causes, the intrigues of foreign powers, and the deference shown to the Peshwa by the Maratha leaders. The city was bright with bands of armed men, handsome horses, rich palanquins, and gorgeous elephants, messengers ran from place to place, all was gay with sports, dances, and merrymaking. [Capt. Robertson, 1st Feb. 1825. Bombay, Rev. Rec. 117 of 1825, 533-534.] In 1802 Ghatge came to Poona and made demands for money from the Peshwa. Bajirav called him to his palace, but Ghatge, suspecting treachery, forced his way out, leapt on a horse, escaped, and returned to Poona with a force threatening to attack the city. The British Resident was called in to settle Ghatge's claim and Poona was saved further loss by an urgent message from Sindia requiring Ghatge in Malwa. Meantime Yashvantrav Holkar, who was burning to avenge his brother Vithoji's disgraceful death, was marching towards Poona. Sindia's army joined the Peshwa's and took a position close to Poona near the present cantonment. Bajirav ordered Yashvantrav to retire but he refused to obey. On the morning of the 25th of October the two armies met, and, after a well' contested fight, the battle ended in a complete victory for Holkar. Bajirav making sure of victory came to see the battle, but the firing frightened him, and on learning the fate of the battle he fled to Sinhgad. For some days after his victory Yashvantrav showed great moderation at Poona. He placed guards to protect the city, treated Bajirav's dependants with kindness, and made several

attempts to persuade Bajirav to come back. But Bajirav fled to the Konkan. When Holkar heard of Bajirav's flight he levied a contribution from the people of Poona. The contribution was arranged by two of Bajirav's officers and it was carried out in an orderly manner. But it was followed by a plunder of the city as complete and as wickedly cruel as Sindia's plunder in 1798. The loss of property was unusually severe as guards had been set to prevent people leaving Poona. Meantime Bajirav had signed the treaty of Bassein and General Wellesley was on his way to reestablish Bajirav in Poona. Near Baramati, on the 19th of April 1803, General Wellesley learnt that Bajirav's brother Amritrav was likely to burn the city to prevent this misfortune. General Wellesley pressed on and used such speed that, though kept six hours in the Little Bor pass, he reached Poona on the 20th of April a march of sixty miles in thirty-two hours. [Wellington's Despatches, II. 102.] Of the state of money matters in Poona General Wellesley wrote: 'I have drawn in favour of a savkar at Poona who promises to pay one *lakh* of rupees a month. However, from the Peshwa down to the lowest cooly in the bazar, there is not a Maratha on whom it is possible to rely that he will perform any engagement into which he enters, unless urged to the performance by his fears. I doubt therefore this savkar.' [Wellington's Despatches, II. 102.]

Lord Valentia, 1803.

In October 1803 the English traveller **Lord Valentia** describes Poona as an indifferent town, with several large houses built with square blocks of granite to about fourteen feet from the ground. The upper part was a framework of timber with slight walls merely to keep out the wet and air. The lime bricks and tiles were so bad that the rain washed away any building that did not depend on timber for its support. Timber was brought in abundance from the hills to the west and was not much dearer than at Madras. Holkar's stay did not improve the town. He pulled down several large houses in search of treasure and it was said that he found much. Lord Valentia forded the river both going and returning; the foundations of a granite bridge rose above the water, but they were laid in misfortune and superstition would not allow their completion. A bridge of boats had been laid across by General Wellesley but was not kept up. [Valencia's Travels, II. 115.]

Lord Valentia described Colonel Close's residence at the Sangam as a charming spot, adorned with cypress and fruit trees and with a handsome bungalow. [Travels, II. 123.] When (1792) Sir Charles Malet first came as Resident he was obliged to live in a wretched house in the town, and during the summer had to pitch his tents on the banks of the river. Remonstrances at length gained him leave to build a temporary house in the Sangam garden. It was burnt down and Sir Charles was allowed to build the existing bungalow. Still no fence was allowed and Colonel Close had great difficulty in getting leave to make a gateway and some additional buildings. The natives burnt their dead on the opposite bank. At four in the afternoon of the 14th of October a deputation from the Court, the highest compliment the Peshwa could pay, came to the opposite side of the river from the Sangam and Lord Valentia, accompanied by Colonel Close and their suites, set off. At starting a salute was fired. The Peshwa's minister for British affairs and the under minister, attended by a large body of horse and some foot soldiers, led the procession, and were joined by an escort of British infantry. In the place before the palace

were drawn out the Peshwa's cavalry and infantry guard and his elephants, by no means a splendid body. Kettledrums were beating, the servants were all at their posts, and the crowd was considerable. Lord Valentia waited a few seconds at the door till Sadashiv Mankeshvar the minister had come near. He then left his slippers, and with Colonel Close supporting his left arm, stepped on the white cloth with which the floor was covered. He embraced the minister and presented the officers of his suite. The Peshwa entered the room and stepped on his cushion or *gadi*. Lord Valentia hastened towards him supported by the Colonel on his left and the minister on his right. His Highness continued standing and slightly embraced Lord Valentia with his right hand. Lord Valentia was next presented to the Peshwa's brother who was on the right and who also embraced him. Lord Valentia then returned and presented to the Peshwa the gentlemen of his suite who were also embraced. They then sat down. The minister was next His Highness on the left, but rather behind. Lord Valentia was near to him. Next to Lord Valentia was Colonel Close and then the other European gentlemen. They had no chairs or cushions and were not allowed to put out their feet, as to show the sole was disrespectful. His Highness wore no slippers. The etiquette of the Court was silence and when anything was said it was in a low whisper. Lord Valentia spoke to Colonel Close, who translated it to the minister, the minister stretched himself out towards His Highness on his knees with his hands closed and raised, and, in a low voice, reported what Lord Valentia had said. By the same conveyance the answer was returned. Lord Valentia first asked after His Highness's health and was told that he was well, and that he hoped Lord Valentia had arrived in good health. Lord Valentia then asked after the health of the Peshwa's brother. The message was carried across the room, in front of the cushion by Anandrav. The answer was complimentary. Then through the minister His Highness expressed a wish that the party might retire into a more private place that conversation might be freer. Lord Valentia immediately arose and followed the Peshwa into a very small room attended by Colonel Close, the minister of the state, the under minister, and the minister of British affairs. His Highness seated himself on a small Turkey carpet in the corner of the room. He placed Lord Valentia next him on his left and the rest formed a part of a circle in front of him. The Peshwa then began a very interesting conversation in which he considerably relaxed from his etiquette, smiled, and frequently spoke immediately from himself to Lord Valentia and Colonel Close. With all the disadvantages of interpretation, Lord Valentia could perceive that the Peshwa gave a very elegant turn to the expressions he used. Among many other compliments the Peshwa expressed a wish to give Lord Valentia a fete at his country house. To this Lord Valentia with pleasure agreed. This fete had been previously arranged and was to take place after the Peshwa had honoured Lord Valentia with a visit. On political subjects the Peshwa spoke fully and clearly and seemed much better informed than Lord Valentia had reason to expect. After about an hour the party returned to the Darbar. Lord Valentia was so extremely tired with his position that it was with some difficulty he could, rise and for a few minutes was obliged to rest against the wall. No conversation passed after the Peshwa was seated on the cushion. Betel leaves were placed before him in a large gold plate; on the top was a gold box containing a parcel of the same; *attar*, rosewater, and spices were in the same line. Anandrav, the minister for British affairs, gave rosewater, *attar*, and spices to Colonel Close; to Lord Valentia he gave *attar* and rosewater. The party then rose, and His Highness' with his own hand presented Lord Valentia with the gold box filled with the betel leaves. The

guests then made their salutations and retired, the ministers attending them to the door. The Peshwa and his brother were in plain white muslin dresses without a single jewel. The minister had some handsome flat diamonds in his turban, a neck-lace of emeralds and large pearls, and earrings of gold from which hung the finest pearls Lord Valentia had ever seen. They were perfectly round and clear and were as large as the pupil of the eye. The palace was a fairly handsome building and was very clean. The Darbar-room was large, and was supported by handsomely carved wooden pillars. The state cushion was of white muslin richly embroidered in gold and coloured silk. With the exception of a few who carried silver sticks the Peshwa's attendants stood round outside of the pillars. Holkar had not done much harm to the palace but he had carried away everything movable, including a small armoury and the elephant cars. Lord Valentia thought Poona well placed and that when it had enjoyed a little rest, it would be a handsome capital. On the 16th, to receive the Peshwa, Colonel Close pitched a large tent in front of his house and two tents joined to it without sides so that they formed one very large room. The state cushion was sent forward and placed in the centre as at the Peshwa's own Darbar. When the Peshwa came in sight Colonel Close mounted an elephant and advanced to meet him. Lord Valentia waited his approach at the door of the tent. The Peshwa came close up, but did not dismount till the minister, the under minister, and the minister for British affairs had paid their compliments and had presented to Lord Valentia the different nobles and honourables who attended him. They made their salutations and passed into the tent. His Highness then descended from his elephant along with his brother, who rode behind him. Lord Valentia made his compliments and leaving a space on his right hand for the Peshwa to walk in moved into the tent. All seated themselves as at the Darbar. After a few compliments and while the dancing girls were singing and dancing, betel leaf and *attar* were placed on the ground before His Highness and he ordered them to be given to the *sardars* and other attendants. Lord Valentia then asked His Highness to allow him to robe the Peshwa and his Brother. The Peshwa granted leave and the trays were brought forward and laid before them. Lord Valentia rose and passing in front of the state cushion began with the Peshwa's brother. A jewelled crest and other ornaments were set in his headdress and a necklace of pearls with a pendant of coloured jewels was fastened round his neck. The Peshwa's headdress and his neck were then adorned with jewels and in addition his wrists were encircled with diamond bracelets. He had a telescope, and a sweetmeat box, ornamented with a beautiful picture of the goddess Ganga. His brother had a sweetmeat box with Indra painted on it. The figures were appropriate to their character. His Highness was much attached to the ladies. His brother was grave and ceremonious. Lord Valentia then gave betel leaves and *attar*; the *attar* was poured into Lord Valentia's hands, who gently rubbed it down both the shoulders of the Peshwa; this was done at the Peshwa's request, and was the highest compliment. His Highness was in such excellent humour, that, though it was a public visit of ceremony, he frequently smiled and addressed himself to Lord Valentia and to Colonel Close. The ministers did not receive the *attar* as it was Lord Valentia's wish that they should stay after the rest were gone. There was great jealousy, between the ministers and the Mankaris so that to have made the ministers presents in the company of the Mankaris would have been an insult to their dignity. Lord Valentia mentioned to the ministers that a horse and elephant were at the gate as presents to His Highness. These were always given on state occasions but without being habited as was the practice in other courts. It was nearly dark before

the Peshwa left. The ministers stayed a short time and received Present according to their rank, the jewels being tied by Colonel Close's. Native Assistant. They then received betel leaf and *attar* from Lord Valentia's hands and departed. The presents were provided by the East India Company. His Highness' were worth about £1200 (Rs. 12000), the others; altogether nearly £800 (Rs. 800). The *nach* girls had sung some very interesting Marathi or as they call them Deccani songs, which Lord Valentia's party now made them repeat as a relaxation from the fatigue of a state visit. Lord Valentia afterwards learnt that on this day there was a great religious festival at which His Highness ought to have assisted and that he was fined several hundred rupees for his absence. This provided a handsome fast for the Brahmans. At night Parvati's temple was covered with lights. On the 20th a little after four, Lord Valentia set off with the usual retinue to pay a visit to the Peshwa at his country house the Hira Bag. The road was for a considerable distance covered by his Highness' followers, chiefly horsemen, so that it was rather difficult to get to the gates. Fortunately Lord Valentia had a party of sepoys from the lines who joined on the opposite bank of the river, and made way for him. The Hira Bag was prettily placed on the bank of a large lake perfectly irregular in its shape. In the centre of the lake was a small island with a temple. The opposite bank rose into a sugarloaf hill whose top was capped by the white buildings of Parvati's temple. The garden house was insignificant and had never been finished. The garden was fine and was ornamented with several mango trees and a great number of cocoa palms. The cushion was placed in a veranda opening on a basin of water with fountains and covered by a trellis of vines. Lord Valentia brought His Highness news of the surrender of Chandor fort to the united army of the British and the Peshwa. His Highness was in great spirits and observed that his father always wished for the friendship of the English but that it had remained for him to reap the blessings of it. The Peshwa then asked Lord Valentia if he would procure for him an Arab mare and Colonel Close assured him that he would try his best. The ceremony at Lord Valentia's entrance was the same as on the former occasion and he was seated in a similar situation. The party soon had notice to move upstairs: the Peshwa passing through a back door, while the guests mounted by a narrow staircase to a platform with two verandas one at each end. In the farther veranda a white cloth was spread with plantain leaves one for each of the English gentlemen present. On each leaf was a Brahman's dinner, rice plain and sweet, pastry thin as paper and rolled up, pastry cakes, bread and peas pudding. Along one side was a row of sweets like paints on a pallet; on the other were seven different kinds of curried vegetables. On one side of the leaf were rice-milk, clarified butter, and some other liquids in small plantain leaf pans, which were all excellent of their kind. The guests had taken the precaution to bring spoons knives and forks which they used actively out of respect to their host who soon joined the party by seating himself on the cushion a little on the outside of the veranda. When the guests had finished the Peshwa retired and the guests soon followed. After the guests had seated themselves below betel leaf was laid at the Peshwa's feet and served. Lord Valentia's servant had placed himself at the bottom of the line, and was consequently served first. They proceeded upwards till they reached Lord Valentia, where they stopped. The presents were then brought in again beginning with Lord Valentia's servant. They consisted of a pair of shawls, a piece of brocade, and a piece of cloth; the whole worth about £20 (Rs. 200). There was no visible difference between these and other presents to Messrs, Young, Sail, Murray, and Smith. The gentlemen of

the establishment were totally overlooked. Lord Valentia's presents were then brought forward which consisted of the same articles and a piece of muslin. There were also jewels in a tray: these were put on by the minister which had answered every purpose of a turban, the *shirpech*, *jiggar*, and *tura* looking better on a native dress. All the presents were better than had ever been given on a former occasion, the shawls being new and good ones for this part of India. A horse and elephant were at the door. The horse was a fine animal and in good condition, a most unusual circumstance at Poona. The *attar* was given to Lord Valentia and Colonel Close by the minister. The box of betel leaf was delivered by His Highness himself. After this was over a sword was given into the Peshwa's hands and by him presented to Lord Valentia. It was handsomely mounted in green and gold and had a very fine blade. The sword was not part of the real gifts of the ceremony and Lord Valentia therefore valued it the more, assured the Peshwa that he would hand it down to his son and his son's son, and kept it by him instead of delivering it to his servants as he had done the trays. The *nach* girls were the same as on the Peshwa's visit to Lord Valentia. The Peshwa's own dancing girl was rather old but was said to have a fine voice. She was too busy in performing before the deities during that season of festivity the *Dasara* to attend Lord Valentia and his party. A few compliments passed at taking leave and the Peshwa paid Lord Valentia the unusual compliment of requesting to hear of his welfare. The minister attended the party as far as the end of the carpet and then took his leave. Lord Valentia's party returned through the town which was much larger than he had expected and the market much finer. There were several large houses, three storeys high; the temples were insignificant; the number of wretched objects was small. [Valentia's Travels II 113 -125. The wretched objects referred to by Lord Valentia were the poor famine-stricken people.]

Sir J. Mackintosh, 1805-1808

In 1805 Sir James Mackintosh the Recorder or Chief Justice of Bombay went on a visit to Poona. He found the chief streets of the city paved with stone and the city regarded as one of the best built native towns in India. The Peshwa's residence the Saturday Palace or Shanvar Vada (32) from its size well deserved the name of a palace. [Mackintosh's Life I.274.] On the 10th of November 1808 Sir James Mackintosh paid a second visit to Poona. He learnt from Colonel Close the Resident that Poona had a population of about a hundred thousand. The police was entrusted to a military Brahman of the family of Gokhle who had a large establishment and whose duty was either so easy or so well performed that notwithstanding the frequent meeting of armed men instances of disorder were rare. [Life, I. 460.] In 1813 a brigade of British troops was stationed at Poona near Garpir (68), a spot originally chosen by General Wellesley to guard the city. In 1816 the unknown author of a *Fifteen Years in India* described Poona as of modern build and not of any great extent nor imposing in appearance. The city lay in a garden-like plain with fine mountain scenery in the distance. Covering the city was a high mountain range with several romantic hill forts in sight and near the city walls was the round and steep Parvati hill. It was well watered by the Mula and Mutha which met near the city. The streets were broader in general than in other native towns and showed vast wealth. The city had several temples but they were modern and not held in great veneration. In point of strength the city was not worth much consideration, but its wealth and its Brahman

government gave it an importance among Maratha states. [Fifteen Years in India, 450-451.] In a letter to Lady Keith (27th November 1816)

Mr. Elphinstone, 1816.

Mr. Elphinstone gives a livelier picture of the sights of Poona, or rather of the part of Poona close to the Sangam. I am writing, he says, in a garden of trees some of which have no names in English and others are among the rarest in your green houses. My room is filled with the smoke of incense burnt before a Hindu god not ten yards from my house, where troops of women come, with music playing before them, to hang garlands, to sacrifice sheep, and to cut off their own hair, which they have vowed to to the divinity. In the same garden there is a very ancient ruined tomb of a Muhammadan female saint, which is a place of such sanctity that an oath taken in it is reckoned sacred, even among the faithless people. I have just heard loud, lamentations over a dead body and I now see a funeral pyre kindling on the banks of a river close at hand, where I have before seen the living consumed with the deal. The mourners are sitting in silence on the ground looking on till it be time to gather up the ashes of their friend. Two large elephants are wallowing in the water at no great distance, and on the road that crosses the river are buffaloes, camels, horsemen with long spears and loose drapery, and foot passengers male and female in dresses of all sorts and colours. At this moment a procession is passing of Muhammadans dressed like Arabs, performing a frantic dance and flourishing their drawn swords in honour of the sons of Alli of whose martyrdom this is the anniversary. The whole town is ringing with drumming trumpeting and shouting, occasioned by the same festival, and to make the whole still more unlike England the country round is laid waste by a body of predatory horse, who have made an inroad from beyond the Narbada, and have drive the inhabitants of the neighbouring villages in on the capital. [Cole brooke's Elphinstone, I. 343.] On the 13th of June 1817 the treaty of Poona was drawn up by Elphinstone and signed by Bajirav Peshwa. [The terms of the treaty of Poona are given in Part II. p. 297.] On the 14th of October Mr, Elphinstone and Bajirav met for the last time. Bajirav spoke of the lose he suffered under the treaty of Poona. Mr. Elphinstone told him that his only chance of regaining the goodwill of the English was to lose no time in sending his troops north to aid the English in putting down the Pendharis. Bajirav assured him that his troops would start as soon as the *Dasara* was over. *Dasara* Day fell on the 18th of October. It was the finest military spectacle in Poona since the accession of Bajirav. Every day of the week after *Dasara* (19th - 25th) became more interesting. By night and day parties of armed men kept flocking into Poona from all sides. The British troops were cantoned to the north of the town in a position originally chosen by General Wellesley for the protection of the city. Gardens and enclosures with high prickly-pear hedges ran in many places within musket-shot of the lines, affording not only every advantage for the attack of the Arabs and irregulars, but, in case of disaffection among the sepoys, every facility to desert. Small parties of horse came out and encamped round the British cantonment, and in a few days more were augmented to large bodies, while a strong body of Gosavi infantry took a position on one of the flanks. The Sangam being at some distance from the cantonment the Vinchurkar's horse with some infantry and guns encamped between the Residency and the village of Bhamburda. Besides these preparations all reports showed that an attack was immediate. The Peshwa was urged to

strike before reinforcements could reach Mr. Elphinstone. On the night of the 28th October the guns were yoked, the horses saddled, and the infantry ready to surprise the British lines. Next day (29th October) Mr. Elphinstone complained to the Peshwa of the crowding of the Maratha troops on the British lines. At four in the afternoon of the 30th of October the European regiment, after great exertions, reached the cantonment. With the exception of 250 men left to guard the residency, Mr. Elphinstone, on the 1st of Nov. moved the troops to a good position at Kirkee four miles north of Poona. The British cantonment was plundered and events culminated on the 5th of November 1817 in the battle of Kirkee when 2800 British troops signally defeated a Maratha host of 33,000. [Details of the battle of Kirkee are given above pp. 374 - 381.] The residency was sacked and burnt on this day, and all Mr. Elphinstone's property, manuscripts, and oriental curiosities, valued at upwards of £8000 (Rs. 80,000), were either plundered or consumed. Poona city, left with only a small garrison, was surrendered on the 17th of November and the British flag was hoisted on the palace under a royal salute. [Fifteen Years in India, 486.] The greatest care was taken to protect the town people and order and peace were soon established. [Many outrageous acts on British officers and soldiers had raised indignation to the highest pitch and Mr. Elphinstone and General Smith found it very difficult, almost impossible, to save Poona from the sack for which the soldiery were eager. The British banker successfully solicited protection for the bankers and merchants, and guards were also posted at the chief public offices and the Peshwa's palace, Some trifling excesses were committed in the suburbs, but the city suffered no injury and the loss of property was insignificant. Considering all circumstances the forbearance of the troops deserved high praise. Colebrookes Elphinstone, I. 4,] But many of the people especially jewellers and pearl merchants, who had fled to Sinhgad, suffered. [Grant Duffs Marathas, 655; Fifteen Years in India, 490.] Details of Artillery and Pioneers, one regiment of Light Cavalry, one European regiment, and three battalions of Bombay Native Infantry, were placed in the city and cantonment. [Blacker's Maratha War, 315-16.] In 1819 Mr. Elphinstone detected a conspiracy in Poona in which men of desperate fortunes, some of them Brahmans, took a lead. The object of the conspiracy was to murder the Europeans at Poona and Satara, to surprise the chief forts, and to take hold of the person of the Satara Raja. Mr. Elphinstone met the conspiracy with promptitude and ordered the ringleaders to be blown from guns remarking ' that the punishment contained two valuable elements of capital punishment, it was painless to the criminal and terrible to the beholder' [Colebrook's Elphinstone, II 74 75,]

Capt. Robertson, 1821-1825.

Captain Robertson the first Collector of Poona writes ' the fall of the Peshwa was a great loss to Poona. Into the city had flowed large sums not only from the tributary states but also from the surrounding districts. Though Bajirav himself was fond of hoarding his money, among his courtiers and his military officers there were many who received large sums in bribes and freely spent what they made. The stoppage of war over the whole of India closed to the bankers their favourite and most profitable investments and there were no other channels into which their wealth could be turned. With the end of the gaiety and richness of Bajirav's court the demand for the rich; silks and tissues of gold, which had vied with the produce of Paithan, ceased, and the dealers and weavers were

impoverished. The poorer of the *muttsaddis* suffered severely. Some moved to smaller towns where living was cheaper, others took to husbandry or retired to their homes in the Konkan, others entered Government service; about twenty-five of them were employed in mamlatdars' office, and at the civil court. A considerable number (about 600 in all), of whom about 400 were Musalmans and 200 Marathas, men to indolent habits who refused all work but fighting went idly about Poona, and lived in brothels and were often indebted for a meal to the keepers of brothels,[10th October 1821; East India Papers, IV. 588, 594.] others continued to hang about in the city for years, hoping for-military service, and their growing poverty was turned to distress by the high prices of grain which followed the years of scanty rainfall ending in 1825. In 1825 instead of its old bustle and gaiety the city presented the tameness of poverty; the people led aimless idle lives without employment and without an object. Scarcely a horse passed along the listless streets which were empty except for starving tailors and better fed butter dealers.[1st February 1825; Bom. Gov. Rev. Rec. 117 of 1825, 533 - 534]

Hamilton, 1820.

In 1820 according to Hamilton, Poona had a population of 150,000. It covered probably not more than two square miles, was *Bishop Heber, 1825* indifferently built and wholly open and defence less, more like a large village than a city. [Hamilton's Description of Hindustan, 196.]

Bishop Heber, 1825.

In 1825 (27th June) Bishop Heber describes Poona as lying in the centre of an extensive plain, about 2000 feet above the sea, surrounded by singularly scarped trap hills from 1500 to 2000 feet higher. The plain was very bare of trees, and though there were some gardens close to the city, they were not sufficient to interrupt the nakedness of the picture, any more than the few young trees and ornamental shrubs of the cantonment. The most pleasing feature was the small insulated hill of Parvati. The city was far from handsome and of no great apparent size, though it was said to have a population of 100,000. It was without walls or fort, it was irregularly built and paved, with mean bazars, it had deep ruinous streets interspersed with *pipal* trees and many small but no large or striking temples, and as few traces as can well be conceived of having been so lately the residence of a powerful sovereign. Bishop Heber found the chief palace large with a handsome quadrangle surrounded by cloisters of carved wooden pillars. Externally it was mean, as were also the smaller residences which were whimsically known by the names, of the week. The ground floor of the chief palace was used as a prison, and the upper storey as a dispensary and an insane hospital. [Journal, II, 208 209.]

Jacquemont, 1832.

In 1832 the French traveller and botanist Jacquemont, a sharp but ill-tempered observer, described Poona as a large city very dirty and ill built. Nothing bore witness to its former greatness. Of the 50,000 inhabitants only a few were Musalmans. There were very many Brahmans, and many temples but none remarkable. The Brahmans lived almost all as

priests and beggars, very few went into the army. The population was much mixed with Konkanis Gujaratis and Deccanis, and there were Marwari merchants and Bohoras. There were no Parsis in the city, but Parsis had a monopoly of the market in the camp. The people were small and very black, their features had none of the classic regularity of Hindustan, but they were shrewd and sharp, the expression hard but not unpleasant. The lowest classes wore a narrow girdle and a black or red turban. The better-off had a waistcloth or an open shirt. Each caste had a different form of headdress generally ungraceful, coming low in front and behind and high over the ear so as to show the earrings. Almost all women wore silver toerings and had their arms covered with silver, copper, ivory, or lacquered bracelets. The people lived on rice, wheat, and the flour of grains. Wood was extremely rare and dear and the dung of cows as well as of horses was the universal fuel. The streets were very dirty, and in the morning were thronged with men and women. On Parvati, near the temple, were the ruins of the Peshwa's palace, and great mango groves stretched at the foot of Parvati towards the Mutha and surrounded the city to the south. But the trees were wretched and vegetation had no strength except on the river side. From the hill top Poona looked a mixture of huts and trees such as *pipals*, *bors*, and *babhuls*, with a few cocoanuts. There were two wooden bridges, one built by the Marathas and the other by the English. [Voyage Dans l' Inde, III. 554.]

1832-1884.

During the fifty years since 1832 Poona has advanced more perhaps than any of the leading towns of this presidency except Bombay. No notices or details regarding the city have been traced, but from what is known of the former condition of the district it probably made no rapid progress before 1850. During the 1857 mutinies there were signs of disloyalty and sedition, but the strong body of European troops prevented any attempt at an outbreak. Since the opening of the railway in 1860 the trade and prosperity of Poona has rapidly increased. The making of the railway, the American war, and the building of the barracks, and most of the leading public buildings between 1860 and 1870, added very greatly to the wealth of the city. This was followed by a time of depression which was at its height during the 1876-77 famine. Even during the famine many classes of townspeople shared in the profits which were made in the great trade in grain. In 1879 the opening of the Khadakvasla water works rapidly restored those of the landholding classes who had suffered from the famine, and has turned into gardens large tracts round the city which were formerly bare waste. In 1879 (May 13) Poona was disturbed by the burning of the Budhvar palace and the attempt to burn the Vishrambag palace. Both fires were the work of incendiaries, and seem to have been prompted by a wish to cause loss and annoyance to Government and to increase the feelings of uneasiness which the gang robberies carried on by the openly disloyal Vasudev Balvant Phadke had caused. Since 1879 the progress of the city has been steady. The making of the West Deccan Railway, though it may deprive Poona of some of its present branches of trade, will do much to enrich it and to increase its importance as the chief trade centre in the Bombay Deccan. The growth of Poona is shown in the increase in the number of its people. The total in 1851 was 73,219. By 1872 this had risen to 90,436, and to 99,421 in 1881.

PUR.

Pur, a small village six miles south-west of Sasvad, with in 1881 a population of 531, has two temples of Kalbhairav and Narayaneshvar with a yearly fair at each. The fair at Kalbhairav's temple is held on the full-moon of *Magh* or January-February and the fair at Narayaneshvar's temple on the dark thirteenth of the same month.

Pur a small village of 182 people, pleasantly situated in a deep valley surrounded by hills, about twelve miles west of Junnar, has at the source of the Kukdi, a ruined Hemadpanti temple of Kukdesvar covered by a tiled roof. [The antiquarian parts in this account are by Dr. Bhagvanlal Indrajī, Hon. Mem. Roy. As, Soc, of Great Britain and Ireland.]

In going west from Junnar to Ghatghar up the valley of the Kukdi, a pleasant afternoon's work is to leave horses or a pony cart at the village of Hirdi, and to pass south over the east shoulder of the *Kukdesvar Temple*. great scarped head of Shambhu hill, about three miles south-west to Kukdesvar temple, and then, about four miles north-west across the west shoulder of Shambhu hill, over the low plateaus at the side of the Valley to Ghatghar. The country throughout is wild and picturesque. The path lies across the wooded banks of the Kukdi over a rising ground fairly clothed with young *ain* and other forest trees between the two great scarps of Shambhu on the right and Chavand on the left, into the wild valley of the Kukdi with some rice fields, but chiefly upland slopes broken with trees and thickly wooded in the deeper hollows. The path passes west with the mighty crags of Shambhu to the north, the lower wooded slopes of the Shirolī or Kumbai hills to the south, and the steep lofty sides of Mehendola and Shivdola to the west, and north-west. Near the head of the valley, which has narrowed into a woody glen, close to the right or south bank of the narrow rocky Kukdi is the old temple of Kukdesvar. It is hid in the deep shade of a rich grove of mango and *karanj* trees. The spire is gone but the outer walls which had fallen or been overturned have been roughly put together, probably by the Marathas, and are sheltered by a strong thatched roof. Along the bank of the stream and in some walls to the east are many stones, some of them finely carved, and further down the stream is a small cistern cut in the rock. The temple is in the old Hindu or Hemadpanti manycornered style, later than the Ambarnath temple near Kalyan in Thana, varying from the eleventh to the early years of the thirteenth century. It stands on a modern plinth about fiftytwo feet east and west by thirty feet north and south, and one foot four inches high. The veranda or passage between the walls of the temple and the edge of the plinth is about six feet wide. The temple measures about forty feet long by eighteen broad. The original outline of the shrine and the hall or *mandap* is preserved, the four lowest feet of the wall all round the whole temple having escaped overthrow or decay. In the shrine, especially in the south face to the top of the present building, that is to about twelve feet from the ground, the stones remain in their original position. In the north face of the hall, above the line of four feet from the ground, the stones have been replaced in great disorder, many of the most richly carved stones, those for example with a water pot of the khujashape, properly belonging to the ruined spire. The shrine has three faces, to the north, the east, and the south, each face about four feet broad. Between these faces are two main corners to the north-east and the south-east and between the main corners and the faces is a single minor corner. In each of the three

main faces is a niche, the north niche containing a figure of the skeleton goddess Chamunda dancing on a corpse, and the east face of Shiv dancing the Tandav. The south face is at present (Dec. 1882) hidden by a heap of wooden rafters. In the outer face of the south passage, between the hall and the shrine, is some writing apparently mason marks, consisting of a few letters whose form points to some time later than the inscription (A.D. 1060) in the Ambarnath temple near Kalyan in Thana. The prancing figure in the niche in the south face of the hall is Vishnu in the Varah or Boar form, with a mace in his right hand crushing the demon Hiranyaksh under his foot. In the west wall are two niches. The niche to the south of the door has a figure of Granpati and the niche to the north of the door is empty. On the ground the left or north niche below has a figure covered with redlead of Har-Gauri that is Shiv with Parvati in his lap. In the north wall are some groups of goddesses and attendants, but the niche has been lost and its place taken by a spire stone of a *khujashaped* water vessel which is marked with redlead.

In the north-west corner of the plinth of the temple is a small broken shrine and on either side are two terrific skeleton Bhairavs with scalps and spear, and a little to the west a cobra stone or Nagoba and a pillar carved in relief. To the right is a small broken shrine of Bhairav of plain but well dressed masonry. The left Bhairav is in its right place, but the right figure has been moved. Inside the temple in the shrine lies a stone carved in the lotus pattern which the people worship. Facing the temple door are some ruins probably of a monastery. To the south is a sun and moon stone with the ass curse but no writing. To the east are many spire stones.

About six feet in front of the west door is a broken bull with well carved bell necklace. The pilasters and jambs on each side of the west door are in their original places and the door is in its original breadth (2' 9"), but the lintel has been changed and the proper height of the door cannot be fixed. The stone with a modern figure over the lintel is also out of its place.

Inside the temple is in good repair. It includes a hall 12' 5" long by 13' 4" broad, a passage to the shrine 6' long by 7' broad, and a shrine 6' 9" square. The roof of each of these three parts is domed in the Hemadpanti or cross-corner style. The roof of the hall and the passage is supported by four pillars and twelve pilasters. The four pillars uphold the hall dome. Of the twelve pilasters four uphold the dome over the passage to the shrine, four are in the side walls of the hall, and four are in the corners of the hall. A fifth pillar has been set in the middle of the hall face of the shrine passage to hold up one of the cross slabs of the dome which is badly cracked. The hall dome is about 5' 7" square, 10' 2" high to the top of the bracket capitals and 3' 8" more to the centre of the dome. The inner part of the dome is plain except the central stone which is carved in the hanging lotus pattern. The four pillars which support the dome stand 5' 7" apart. In the side walls, between each face of pilasters, are two central niches (3' 1" by 6') with a figure of Har-Gauri that is Shiv with Parvati on his lap in the south niche, a four-handed Kali in the north niche, and pilasters in the corners. Standing on the floor in the north-east corner are three figures of Har-Gauri and one of Vishnu. All the pillars and pilasters are richly carved and are about 10' 2" high to the top of the heavy bracket capitals. [The details of the pillars are a square base 1' 9" and 4" thick, a four-sided shaft 1' 10" long with faces

about 1' 3" broad; an eight-sided band 4" broad; a circular fillet 2"; an eight-sided belt 3½"; another round fillet 2"; a four-sided block 9' high with faces 1' 2 ½ " broad; an eight-sided band 1' broad; a round band 11"; and above three sharp circles the two lowest like discs, and the third with a row of hanging ornament together about 1' broad; then a square capital of 4"; and above the square capital, a bracket capital with four separate faces about 1' 2" broad, each, carved with a figure leaning forward and bearing the roof on its up-stretched hands.] At the mouth of the passage in the east end of the hall a pillar has been added in the same style as the others, probably from some other part of the building, to support the lintel of the passage dome. The passage which is six feet long by 7' 1" broad is covered by a dome which is supported by four pilasters in the same style as the hall pillars. The pilasters are 7' 3 high, the height of the base of the dome where the corners are cut off is 8' 9", and the centre of the hollow of the dome 12'. The inside of the dome rises in three rounded bands, like three bells one within the other, to the central stone which is carved in the hanging lotus pattern. The side walls of the passage have richly carved niches 3' broad by 6' 2" high including the ornamental finish above the niche, the right hand or south niche having a figure of Ganpati, and the north niche a figure of Devi.

In the east wall is the doorway to the shrine. It is 6' broad including the ornamental panels on each side, and 7' 9" high including the overhanging eave and the carved, work above the door. Over the shrine door are three bands of carved figures, each about a foot broad, separated by narrow belts of moulding. The highest band of figures is carved in the eight-sided belt of stone which supports the dome. They are standing Yoginis forty in all and five in each of the eight faces. Below, over the door, are nine seated figures representing the *navagrahas* or nine planets [The nine planets are Mercury, Venus, Mars, Jupiter, Saturn, the Sun, the Moon, Rahu, and Ketu] the rest of the figures in this row are four angels, two on either end, bearing garlands. The third belt has figures of the five Devis. [The other rows have angels bearing garlands.] The door into the shrine is 5' 2" high 2' 8" broad and 2' deep. Two steps lead down into the shrine which is 6' 9" square. The floor is paved with dressed stones. In the centre is a *ling* in a *ling-came*, and leaning against the back wall is a rude copper mask of a man's face with staring eyes and curled moustache, which is put over the *ling*. The temple ministrant is a Koli and the offerings are flowers. A fair is held at the temple on *Mahashivratra* in February-March. In the south-east corner is an opening some feet from the floor through which water can be poured till the god is flooded. In the north wall is a channel to carry off the water. There is a shelf in the north wall about five feet from the ground and a small niche in the south wall. The rest of the walls are of dressed stone, plain except corner pilasters, a carved outstanding block in the middle of each face about ten feet from the ground, and five bands of shallow carving under the beginning of the dome. The dome which is plain, except a slight ornament in the centre stone, begins ten feet from the ground and is four feet deep.

From the temple the path to Ghatghar leads across some rice fields to the right of the village of Pur, up a steep wooded pass, over the west shoulder of Shambhu with fine views of its great beetling crags and of the huge scarp of Chavand to the east. From the crest of the shoulder the path leads through pleasant woods with fine views across the valley of the north Kukdi to the wild row of peaks which forms the western face of the

Anjavla hills. In front the bare scarp of a hill, apparently with no more marked name than Pahad, runs into the valley, and beyond, to the west, are the great rocky sides and pointed top of Jivdhan. About a mile and a half from Ghatghar on the left, close to the path, in a square masonry enclosure of low roofless walls of earth and stone, are two *ling*-like stones known as Kalamja. Outside of the square walls is a circle of rough stones, about seventy-five paces round, marked with redlead. Some of the stones on the north face of the circle are larger and apparently older than the rest. The circle is interesting from its resemblance to Vetala's guardian and other rude stone circles. The chief worshippers are said to be Kolis of the neighbouring village of Pangli.

PURANDHAR FORT.

Purandhar, 18° 17' north latitude and 74° 2' east longitude, 2566 feet above the Poona plain and 4472 feet above the sea, is a famous fortified hill which gives its name to a subdivision whose head-quarters are at Sasvad, about six miles to the north-east of the hill fort. It is the loftiest peak in a range of hills about twenty miles south-east of Poona. From the south slopes of the Sinhgad-Bhuleshwar hills near the Katraj pass, and about ten miles south of Poona, a spur strikes south-east and rises into a group of five towering peaks, Purandhar, Vajirgad, Beruka, Bondalgad, and Suryaparvat. Purandhar lies about twenty miles south-east of Poona by the Bapdev pass, and about twenty-five miles by the Deva pass and Sasvad. The Sasvad route is alone fit for carriages. From the travellers' bungalow at Sasvad a very fair road broken in places by stream beds leads about six miles south-west to the foot of Purandhar hill. From the Peshwa's mansion at Sasvad Purandhar appears less lofty than Vajirgad which stands slightly in advance and partly hides the loftier hill. From the Bapdev approach, which alone shows their true features, the hogbacked Vajirgad and the saddlebacked Purandhar are separate, except for one narrow ridge.

Dacription

Purandhar is the larger, higher, and more important of the two hills. From the top of the Bapdev pass a twelve-mile long road leads by the village of Chambli to Purandhar. As they are neared, the basalt summit wall of both hills is seen to be crowned with a masonry ruin studded here and there with bastions. Purandhar, the larger and higher, is varied by two risings, on the higher of which, the loftiest point in the range, is a Mahadev temple. The hill on which this temple stands is part of the upper fort of Purandhar, while on its northern face, 300 feet below the temple and upwards of 1000 feet above the plain, runs a level terrace on which stands the military cantonment, flanked on the east by the barracks and on the west by the hospital. The northern edge of the terrace is defended by a low wall with several semicircular bastions and a gate flanked by two towers. This is called the Machi or terrace fort. At the foot of the hill is a well built rest-house, from which the ascent leads by an easy wide road with a gradient of one in eight-- Halfway up the road branches to the right and left, the right branch leading to the hospital and the left to the store gate in the centre of the cantonment and to the barracks. From the middle of the cantonment a winding road 830 yards long runs towards the upper fort and ends in a flight of rude stone step which wind between a loopholed wall of masonry and the basalt

cliff on which the fort stands. A sharp turn leads suddenly to the Delhi Gate flanked by solid bastion towers.

Passing left from the Delhi Gate the path goes along a narrow ridge flanked on each side by loopholed walls. It is in some places only eight feet wide, and, with a sheer fall on either side of over 300 feet, leads to the Kand Kada or *Sky Scraper* bastion, the most eastern point of Purandhar, commanding a view of Vajirgad and the Bottle Hill, and across the rich Bhima valley to the distant Mahadev range. Here is a bungalow, the oldest on the fort built by Colonel Leeson. Near the bungalow is a small reservoir and postern gate called Chor Dindi Darvaj'a or the Secret Gate. Going back to the Delhi Gate the path leads up to the Ganesh Darvaja passing by a small chamber in the thickest part of the right hand flanking, where Shahaji the father of Shivaji was confined in 1649 by Mahmud (1626 -1656) the seventh Adil Shahi king. On the left is a ruinous figure of Ganesh which gives its name to the gate. Through a third plain gate with a bastion on the right called the Bavta Buruj or Banner Bastion, the way leads to a bombproof building, once a granary and now a summer residence for the chaplain. Near the granary rises a solid mass of masonry the site of a palace said to have been built by Abaji Purandhare, the founder of the great Purandhare family of Deshasth Brahmans who were closely allied with the Peshwa's family. A little further on is a bungalow called the Eagle's Nest and slightly behind it is a mosque; the path continues towards the west with, on the left, two small covered cisterns looking like tombs and used during sieges to hold oil and clarified butter for the garrison, while on the right is a building used as a bombproof magazine under the shelter of one of the two great risings which mark Purandhar. This rising is called either Love's Seat or the Rasa's Vada that is king's palace as Shahu (1708 - 1749) the grandson of Shivaji began to build a palace here. A little further on the left is a beautiful reservoir called the Mhasoba' Taki. It runs a little under the rock and is fed with springs which furnish drinking water for the bulk of the people throughout the hot season. A little beyond the cistern are two rock-cut chambers used as dungeons. Above runs a rough path to the spur that joins the Raja's Vada eminence with its temple-crowned peak. This spur ends at the foot of a flight of fine masonry steps arranged in sets of five with a fine stone wall on either side of them. The steps lead to a equally beautifully built platform which covers the eminence and from which rises a temple of Mahadev built by the first Purandhare. Going back to the beginning of the ascent the way leads past ruins of Mhars' houses to the Khadda Darvaj'a built by one of the Peshwas for the temple priest. Slightly in advance and ending a spur is a ruinous bastion called Fatten Buruj or Victory Bastion. From this bastion the garrison are said to have leaped about 1790 when surprised by Kolis under one Kuroji Naik. Following the narrow path that runs along the back of a spur on the extreme south-west angle of the fort, a bastion called the Konkani Bastion rises 300 feet sheer. Near this bastion is a bombproof chamber able to hold twenty men, from which criminals folded, in country blankets with their heads and feet uncovered used to be hurled in the *kadelot* or precipice-rolling form of death. Further to the north-west is a triple bastion rudely shaped like an elephant's head and called the Hatti Bastion. Past this bastion the way leads by two deep rock-cut cisterns to the Shendi Buruj under which when it was built a married pair were buried alive. According to two copper plates found in the Inam Commission office the foundations of the Shendi Buruj several times gave way and the king of Bedar dreamt that unless a firstborn son and his wife were

sacrificed on the spot the foundations would never be sure. On awaking the king sent for the grantee Esaji Naik Chive who brought one Nath Naik and his wife Devki and the two were buried alive on the dark eighth of *Ashvin* or September-October. At the same time fifty thousand gold bricks, each brick weighing about twenty-four rupee weights or *tolas*, were put. 25,000 each, in two holes to the right and left of the tower foundation each hole about thirty feet square and twelve feet deep. The work was then finished, the king came to see the bastion, conferred the fort on Esaji Naik and granted two villages worth about £364 (910 *huns*) to the father of the buried boy. [The two grants have been published by Captain Mackintosh in Trans. Bom. Geog. Soc. I. 191 - 258. They were found by Capt. Dods, Inam Commissioner Northern Division, in his office. One is an original plate and the other is a copy of an original plate in the Madras Museum said to belong to the Kolis of Purandhar. One of them is dated the Arab year 587 or A.D. 1191 which seems to stamp the plate as false as there were no Musalman kings at Bedar in 1191.]

From the Shendi bastion the way leads to a fine reservoir on the right called Sakhari Talav or the Sugar Reservoir. A little beyond the reservoir is a stone wall and a few yards further is a good stone house used as a granary and said to have been built by Madhavrav the fourth Peshwa (1761 -1772). A few yards further on comes the point from which the round of the fort was begun. The round extends over two miles and passes by three gateways and six chief bastions.

View.

From this point the way leads to the temple platform, the highest point on the fort, which commands a varied grand and widespread view over crests of mountains, huge blocks of barren rocks and dense forest, clothed ravines, wide-spreading plains and winding rivers. To the north the eye wanders over plains and a mountain, range till it is lost in a distant ridge of pale blue hills eighty miles off. On the first range is the road leading to the Bapdev pass and the temple hill of Narayanpur, and where the range dips to the right of this temple hill, the Deva pass emerges, with, to its right, the square dismantled fort of Malhargad[Details of Malhargad are given above p. 258.] built by the Panse family the hereditary commandants of the Peshwa's artillery. Still more to the right is the Lesser Bor pass through which on the 24th of November 1817 General Smith passed to Pandharpur in pursuit of Bajirav whose immense army had been routed at Kirkee a fortnight before. Half hidden by a spur from the Deva pass, a little to the left of where it emerges, is seen the palace of the Jadhav family [This palace is clearly seen from the road from which it lies about two miles. It is a large square loopholed building with small windows and narrow doors surrounded by a semi-detached loopholed wall.] Between the Deva pass and Purandhar are seen the villages of Narayanpur Chambli and Korait, and on the banks of the Karha, where it meets a small stream, lies, embowered among the bamboo mango and palm groves, the town of Sasvad with its two temples and large square mansion of the Purandhars, all three built at an estimated cost of £60,000 (Rs. 6 *lakhs*). Near the mansion is Bajirav's palace where the Amirs of Sind were confined, now a travellers' bungalow. Looking nearly east, at the end of the Purandhar range show the temples of Jejuri, and not far from the temples, close to the Nira bridge, is Valhe village the traditional birthplace of Valmiki the reputed. Koli author of the Ramayan. Behind are the

Bhima and Nira valleys fringed by distant hills. Turning south in the valley almost beneath Purandhar the windings of the Nira sparkle in the sun, and looking over Shirval and beyond the Mahadev range, in the distance rise Vairatgad Pandavgad and Panchgani, and over the square hill fort of Rohira and the Bori Dara are seen Mount Malcolm and the Mahabaleshvar temple and Raireshvar. To the west, where range after range stretch as far as the eye can see, the view passes over town and village, valley hill and dale, to the peak of Geser and Puluk Khind and still further to Sinhgad standing bold against the sky. North of Sinhgad by the Donje Katraj and Bapdev passes the circle ends in the temple hill of Narayanpur.

Descending to the terrace or Machi, through the triple archway in front of the Delhi Gate, the way leads by a three-pillared rock-cut cave-chamber almost beneath the banner bastion. By the chamber a steep winding path leads down about 2500 feet to the cantonment. Following a road past the canteen over the Bhairav Khind spur, where stood a gate called the Bhairav Darvaja with the ruins of a guard room, begins a four-mile walk that encircles the fort of Purandhar. Following this path, which is a broad well metalled road made in 1856, a little on its left slope are two slaughter houses, and behind them the graveyard, well removed from the camp having the eastern end of the upper fort between it and the cantonment. Continuing this walk, and following its many windings with convenient view seats, on the right rise the steep southern slopes of the upper fort crowned with frowning walls and beetling bastions and covered during the rains with wild flowers thick brushwood and the lovely arrowroot plant.

On the left, looking down on hill and vale, on woody ravines and on the winding Nira, the path leads to a southerly spur the largest on the hill called Bonchika Met or FitzClarence Point as Lord Edward FitzClarence when commander-in-chief, always used it as a drill ground. On its broad tableland is a small unfinished reservoir built by Madhavrav the fourth Peshwa (1761 - 1772). Overhanging the scarp is the Fatteh or Victory Bastion. Beyond, the road passes more to the north and leads to a second plateau with three small springs almost under the abrupt scarp which is crowned by the most westerly or Konkani bastion from which prisoners were hurled. Here lie huge strangely balanced masses of basalt fallen from the fort sides. From this tableland runs a wide south-westerly spur or point called Mesel Met or Kerr's Point. The point is sheltered from the east and is open to the west and commands rich and distant views as far as the Mahabaleshvar range. The road now turns to the east and follows the windings of the hill passing two westerly spurs. A ruined gate called the Konkani Darvaja leads to the hospital spur. From this spur a wall rises till it meets the rock on which the upper fort is built and forms, the western boundary of the lower fort. Above the wall frowns the Shendi Bastion and beneath it are three caves, two of them large, one fifty and the other 160 feet deep. The deeper cave has three chambers. The hospital spur is locally known as *Lagan Mukh* or Wedding Face and the hospital on it stands about a mile and a quarter from the rest-house at the foot of the hill. From the hospital the road passes through the cantonment which stands on a narrow terrace on the north face 300 feet below the upper fort flanked on the east by the barracks and on the west by the hospital. From the hospital the path proceeds, with, on its right, a fine masonry reservoir called the Mukarase Talav said to have been built by Madhavrav the fourth Peshwa (1761 - 1772), and above it a

large roomy bungalow. From the reservoir the road passes by one or two bastions on the left with several guns, said to have been taken by Shivaji from the Portuguese and continues past a large quarry, to a point where the road divides marked by a small stone temple built by a blacksmith about 1795. Taking the upper road, on the right are ten large patcheries, and on the left four sets of bachelors' quarters.

Below these buildings is the Bini Gate, the only gate remaining of the lower fort and called Bini as the Binivala's or Quartermaster General's house formerly stood close by it, where now stands a large modern bungalow. Taking the upper path from the patcheries a small stone temple and well are found, the temple built by Nana Fadnavis over the spot where the people from the neighbouring villages brought their offerings to celebrate the birthday of Madhavrav Peshwa. The bungalow close in front of the temple is built on the site of, and with much of the materials of, Nana Fadnavis' palace. Next comes a fair sized bungalow enclosed with a stone wall and facing west. This bungalow stands on the site of Madhavrav Peshwa's palace, and below it are two temples built by Abaji Purandhare. The road then passes through the market and; leads up to the east end of the terrace on which stands the cantonment. Close below is a fine reservoir called Padmavati or Ruzval Talav the masonry of which is said to have been built by Shivaji. On its north bank an open space covered with mango trees is the site of a small house where died Lord FitzClarence, commander-in-chief of Bombay. The site was bought by his widow for a memorial church. This the Bhairav Khind spur, seems to spring from beneath the scarp of the bastion of the upper fort and running north-east to end its sweep in the rock on which Vajirgad is built. On this the highest and driest spur are the barracks, and at the extreme west on the Wedding Face spur, facing west and overlooking a broad and rich valley, is the hospital.

The earliest known mention of Purandhar is in the reign of their first Bahmani king Ala-ud-din Hasan Gangu (1347-1358) who obtained possession of almost the whole of Maharashtra from the Purandhar range to the kaveri and fortified Purandhar fort in 1350. About 1384 the fortifications were repaired and semicircular bastions were added by the fifth Bahmani king Mahmud I. (1378-1397). Purandhar was among the Poona forts which fell to Ahmad, the founder of the Nizam Shahi dynasty after his success at Junnar in 1486 and continued in the hands of the Nizam Shahis for more than a century. [Briggs' *Ferishta*, III. 120.] Under the early rule of the Bijapur and Ahmadnagar kings Purandhar was among the forts which were reserved by the Government and never entrusted to *jagirdars* or estate holders. [Grant Duffs *Marathas*, 53 note I.]

The fort of Purandhar seems to have passed to Maloji the grand father of Shivaji when Bahadur Nizam Shah of Ahmadnagar (1596-1599) granted him Poona and Supa. [Grant Duffs *Marathas*, 41.] It remained with Maloji's son Shahaji till in 1627 it was taken by the Moghals. In 1637, when Shahaji joined the service of the Bijapur kings, chiefly through his help Purandhar was won from the Moghals. Soon after, the transfer of Purandhar to Bijapur was confirmed in a treaty between Bijapur and the Moghals. Though it passed under Bijapur the fort continued to be commanded by a Hindu. [Compare Grant Duffs *Marathas*, 52, 54, 59.] In 1647, about the time of Dadaji Kondadev's death, the commandant of Purandhar died. As the families were friendly, Shivaji was asked to settle

some points in dispute among the commandant's three sons. He went to the fort, persuaded the younger brothers at night to make their elder brother prisoner, and during the disturbance, secretly filled the fort with his Mavlis and took it without bloodshed, keeping the brothers well disposed to him by the grant of lands and villages. [Grant Duff's Marathas, 61.] In 1665 Raja Jaysing, who was sent by Aurangzeb to the south to conduct the war against Shivaji, promptly despatched a force under Dilawar Khan to attack Purandhar. The fort was resolutely defended by Mavlis and Hetkaris, but, after a long siege, they lost heart and sent word to Shivaji that they could hold out no longer. They would have left the fort but Shivaji asked them to hold it until he should send them word to retire. Shivaji, who was unable to make head against the Moghals, came as a suppliant to Jaysing and Dilavar Khan and handed to them the keys both of Purandhar and of Sinhgad. [Details of the siege and of Shivaji's visit to Purandhar are given under History, Part II. 231 - 234.] After its capture Purandhar remained in the possession of the Moghals, till in 1670, soon after his capture of Sinhgad, it was scaled and taken for Shivaji by Suryaji the brother of Tanaji Malusre. [Grant Duffs Marathas, 109.] In 1705 Purandhar fell to the Emperor Aurangzeb (1658-1707). [Khafi Khan, Munta Khabu-l Lubab in Elliot and Dowson, VII. 373; Grant Duffs Marathas, 177.] In 1707, after the death of Aurangzeb, Purandhar was re-taken by Shankraji Narayan Sachiv an adherent of Tarabai the widow of Rajaram (1689-1700). [Grant Duffs Marathas, 180.] In the same year, on being restored to liberty by the Emperor Bahadur Shah (1707-1712), Shahu of Satara (1708-1749) Shivaji's grandson, came to Poona and summoned Shankraji Narayan the Pant Sachiv to deliver the fort, but Shankraji did not obey. About 1710 Chandrasen Jadhav, who had taken service with the Nizam, drove back the Marathas from the Godavari to the Bhima. To support the local troops Shahu sent Balaji Vishvanath the founder of the family of the Poona Peshwas. Balaji joined Haibatrav and they two fell back on Purandhar. A battle was fought which the Marathas claim as a victory but which seems to have been a defeat as they afterwards retreated to the Salpa pass. In 1714 the first Peshwa Balaji Vishvanath (1714-1720) succeeded in procuring the release of the Pant Sachiv, who was confined at Hingangaon about forty miles east of Poona by Damaji Thorat a partisan of Kolhapur. In return for this service the Pant Sachiv's mother presented Balaji with all the Pant Sachiv's rights in Purandhar and gave him the fort as a place of safety for his family whose head-quarters had been at Sasvad. This transfer was confirmed by Shahu. In 1750 Tieffenthaler notices the hill forts of Lohogad and Purandhar. [Description Historique et Geographique de l' Inde, I. 484.] The fort continued in the possession of the Peshwa till, in 1762, Raghunathrav, the uncle of the fourth Peshwa Madhavrav (1761 - 1772), bestowed it on the Purandhare family. [Grant Duff's Marathas, 368.] After the murder of the fifth Peshwa Narayanrav (1772-73), on the 30th of January 1774, his pregnant widow Gangabai was carried for safety to Purandhar by Nana Fadnavis and Haripant Phadke. On the 18th of April the birth of a son to Gangabai at Purandhar was a deathblow to Raghunathrav's hopes of becoming Peshwa. [Grant Duff's Marathas, 326.] A short time, afterwards letters, intercepted by Haripant near Burhanpur, showed -that a plot was formed by Moroba, Bajaba, and Babaji Naik to seize Sakharam Bapu, Nana, Gangabai, and the infant Madhavrav, all of whom, to escape the chill damps of Purandhar, had come to live in Sasvad during the rains. They heard of this conspiracy on the 30th of June, and at once fled to the fort. In 1775 Nana and Sakharam Bapu returned to Purandhar and from Purandhar managed all state affairs.

[Grant Duff's Marathas, 369.] After much discussion, [Details of the discussion are given under History, Part II. 259 - 260.] on the 1st of May 1776, the treaty of Purandhar was settled and signed by Sakharam Bapu and Nana Fadnavis on behalf of the Peshwa and by Colonel Upton on behalf of the Bengal Government. The chief provisions of the treaty were that Salsette or territory yielding £30,000 (Rs. 3 *lakhs*) a year, and Broach and territory worth £30,000 (Rs. 3 *lakhs*) more, should be left with the English and £120,000 (Rs. 12 *lakhs*) should be paid to them on account of war expenses that the treaty with Raghunathrav should be annulled; that the English should return to garrison and Raghunathrav's army be disbanded within a month; and that Raghunathrav should receive an establishment and live at Kopargaon on the Godavari. [Grant Duff's Marathas, 393-304.] In 1778, fearing the growing strength of his cousin Moroba, Nana Fadnavis retired to Purandhar and agreed to bring Raghunathrav to Poon provided no harm should come to him and his property. On the 8th of June Haripant Phadke and Mahadji Sindia joined Nana at Purandhar, and by a bribe of £90,000 (Us. 9 *lakhs*) gained Holkar to Nana's side. In 1796, alarmed at the threatened attack of Sindia and his minister Baloba on Poona, Nana again fled to Purandhar fort. [Grant Duff's Marathas, 523.] In 1817 Purandhar was one of the three forts which Mr. Elphinstone the English Resident at Poona summoned Bajirav to deliver as a pledge that Trimbakji Denglia would be surrendered. It was restored to Bajirav after a few months. [Grant Duff's Marathas, 634, 646.] In the last Maratha war, after the capture of Sinhgad, Major Eldridge with four companies of the Bombay European Regiment and four companies of Rifles marched through the Purandhar pass to the north of the fortress. A detachment under Major Thatcher, consisting of three companies of the Bombay European Regiment, and five companies of Madras and Bombay Native Infantry, marched on the 8th for the south end of the fort. The head-quarters and the rest of the division continued the march during the 9th, 10th, and 11th, and arrived by way of Jejuri in a position three miles north of the forts of Purandhar and Vajirgad. Within four miles of the camp at the village of Sasvad was a strong stone building the Peshwa's fortified palace, in which a party of 200 men, Arabs Sidhis and Hindustanis, had shut themselves with small guns and made a show of opposition. The walls were so substantial that six-pounders did them no harm. Eighteen-pounders were then brought, but, though these also seemed to make no impression on the walls, they had sufficient effect on the mind of the garrison to induce them to surrender at discretion. The operations against the forts were short. On the 14th of March a mortar battery opened on them; and on the 15th Vajirgad admitted a British garrison. As this place commanded Purandhar the commandant had to accept the terms given to the garrison of Vajirgad; and the British colours were hoisted on the 16th.[Blaoker's Maratha War, 241-242. Pendhari and Maratha War Paper, 259.] In 1845, during Raghoji Bhangria's disturbances, troops were sent to Purandhar in case the insurgents might seize the fort. [Compare Part II. p. 308.]

RAJMACHI FORT.

Description.

Ra'jma'Chi, or the Royal Terrace, is an isolated double-peaked fortified hill on the main line of the Sahyadris, about six miles as the crow flies and ten by path north of the Bor

pass. From the Konkan, thickly wooded at the base, its sides rise about 2000 feet in steep rock slopes which, as they near the crest of the hill, grow gradually treeless and bare. Above the crest, from the flat hill top rises a rocky neck about 200 feet high, with, at either end, a short fortified tower-like head, the inner *Shrivardhan* that is Luck's Increase, high and pointed, the outer *Manranjan* that is the Heart-Gladdener, lower and flat-topped.

A tongue of land about 300 yards broad, joins the Rajmachi terrace to the rough plateau that runs along the crest of the Sahyadris north from Khandala.

Across this tongue of land, about half a mile from the foot of the central hill top, runs a strong stone wall, seventeen feet high and eight thick with a parapet loopholed for musketry and at intervals with bastions pierced for cannon. Within this line of wall a wide stretch of tilled woodland ensures for the garrison a full supply of grain, grass, and fuel. From this upland, at a safe distance from the neighbouring heights, the central hill top rises three to four hundred feet high, a sheer black overhanging cliff crowned by a battlemented peak, and towards the west strengthened by a double line of encircling walls. On the crest of the neck that joins the two peaks, fronting a small temple of Bhairav, stand three old stone lamp-pillars or *dipmals* and two small quaintly-carved stone chargers ready saddled and bridled for the god. The temple, which is little more than a hut, has three pairs of small black stone images of Bhairav and his wife Jogeshvari, presented, according to the temple servant, by Shivaji, Shahu, and Bajirav Peshwa.

From either end of the neck rise the steep fortified sides of Shrivardhan and Manranjan. Shrivardhan, the eastern and higher fort, less sheer to the south than to the north, is in places strengthened by a triple line of wall. On the south side, through the ruined gateway, is reached a chamber cut in the rock once used as a granary or storehouse, and close by a large open rock-cut reservoir. On the north, in a narrow ledge of the steep cliff, hollowed into the hill and always sheltered from the sun, is a cistern with an unfailing supply of pure water. The inner fortification, with a few ruined dwellings, encloses the central peak, the *gadhi* or stronghold. [The Musalmans call it the Bala Killa or upper fort. But unlike most Deccan hill forts Rajmachi was never held by Musalmans and is throughout purely with neither a mosque nor an *idgah*, one or other of which is found in most Deccan forts] Manranjan the outer hill, less completely protected by nature, is very carefully fortified with two high strong lines of wall. Of these the outer line, running along the crest of the cliff, encloses some cisterns and reservoirs of cut-stone; the inner, encircling the flat hill top, has within it the powder magazine, a long low tomb-like roofless building of very closely fitting cut-stone, and close to it the ruins of the captain's house and a cistern. The western wall commands the mind-pleasing or *manranjan* prospect that gives the fort its name. Below lies the royal terrace wooded and stream-furrowed to the north, bare and well tilled to the west, and to the south laid out in fields with a small lake and a shady hamlet, of Koli huts. North and south, beyond the plateau, stretches the main line of the Sahyadri hills, their sides rising from deep evergreen forests in bare black cliffs, to the rough thinlywooded part-tilled terrace that stretches eastwards into the Deccan plain and along the crest of the Sahyadris, which is broken by wild rocky peaks and headlands from Harishchandragad fifty miles to the north to Bhojya eighteen miles to the south. Westwards stretch outlying spurs and ranges

with deep water-worn valleys and steep well-wooded sides. Far off to the right rise Mahuli, Gotaura, Tungar, and the Salsette hills; in front, beyond the long flat backs of Matheran and Prabal lie the harbour island and city of Bombay; and to the left sweep the long range of hills that by Nagothna and Sagargad passes from the Sahyadris to the extreme west of Alibag. [From Rajmachi, as the crow flies, Mahuli is about forty-six miles and Gotaura forty-seven miles; Bombay thirty-eight miles; Tungar, Kamandurg, and Sassu Navghar hills form one range extending from fortytwo to fiftytwo miles and Sagargad is thirtyfive miles.]

The first notice of Rajmachi is in 1648 when it was taken by Shivaji. [Grant Duffs Marathas, 63.] In 1713 the fort surrendered to Angria, [Grant Duffs Marathas, 193.] and was ceded by him in 1730 to the second Peshwa Bajirav (1721-1740). [Grant Duffs Marathas, 231.] In 1776 the impostor Sadoba, a Kanoja Brahman who called himself Sadashivrav Bhau, took the greater part of the Konkan and came to the Bor pass. Here he was opposed and his troops checked for a time but he headed them with spirit and carried the pass and Rajmachi sent him offers of submission. Pretended overtures of submission were made to him by the Poona ministers by which he was for a short time amused, until two of the Peshwa's officers suddenly fell on him in the neighbourhood of Rajmachi, when his whole force fled to the Konkan, and Sadoba escaped to Bombay. [Grant Duffs Marathas, 397.] In the Maratha war of 1818 the fort surrendered without resistance. [Pendhari and Maratha War Papers, 258. In these papers the fort is mentioned as Raiy Machee.]

[RAJUR.](#)

Ra'jur, ten miles west of Junnar, is a large village on the left bank of the Kukdi, with in 1881 a population of 3037. In the village, surrounded by three or four large flat stones and apparently at one end of a raised seat or pavement, about six inches from the ground, is a standing-stone or *ubhi dhond*. It is an undressed block of stone of which 5' 6" are above ground roughly square with faces varying in breadth from one foot to one foot and a quarter, the top as if half-sliced away. One of the large stones, laid on small rough stones to the left of the standing stone, measures 4' 7½" long by 1' 9" broad and 9" thick. The length of the raised pavement in front of the standing stone is 7' 10. and the breadth 6' 10" There are no signs of tools and no letters. The people say it has been there since the beginning of time or *mulpasun*. It is not worshipped and they do not know who set it up. It was men not the Pandavs. About thirty yards to the west is a platform with large rough stones. A little further on the right, buried all but a few inches, is a Sati stone, and about twenty yards further west a second standing stone roughly pointed with 5' 2" above ground and faces about two feet broad.

About a hundred yards to the east of the village are the remains of three Musalman buildings of dressed stone. The first on the right is a ruined tomb of which nothing but the plinth is left. The next on the left is about twenty feet square and is in fair repair except that the dome is gone. Inside are three tombs two of men and one of a woman. There is an inscription over the north door. A few paces to the north-west is a small mosque about eighteen feet by sixteen, with plain masonry walls and a brick dome. Over the prayer

niche is an inscription of two lines. There were corner minarets and a cornice but they are ruined. On the top of a mound, about a hundred paces to the north of the village, to the west is a ruined roofless temple of Mahadev with low walls. In the east face is a door with a carved threshold stone apparently belonging to a twelfth or thirteenth century temple. In front of the temple, about twenty feet to the east, is a row of old stones. On the left is a defaced stone with the remains of an open hand upheld in sign of blessing, a proof that the stone is a Sati stone. The next is a much defaced cobra stone or Nag Raj. The third is the upper part of a broken Sati stone. In the right corner, at the foot of the stone, is the figure of a dead man and a horse in the panel above. Near the top of the stone is an open right hand. The fifth and sixth stones are two battle stones too worn to be read. About two paces to the east, are two carved stones. On the stone to the right in the lowest of three panels are the Sati and her lord both lying down. In the panel above is the woman going to the place of sacrifice seated on a horse and holding something in her up stretched hands. In the top panel a man and woman worship what seems like a *ling* above and a bull below.

Approached from the east the stone buildings of the Musalman tomb and mosque are notable, and behind is a fine view of the great square shoulders of Chavand blocking the mouth of the Kukdi valley. To the left in the Kukdi valley, to the right are the castellated tops of Shambhua and behind and over-topping it the wild shoulder of Karkumba.

RANJANGAON.

Ra'njangaon, nine miles south-west of Sirur, with in 1881 population of 1392, has a famous temple of Ganpati. Ranjangaon is said to be the scene of one of the eight incarnations of Ganpati. The temple is said to occupy the site of a Hemadpanti temple of which four pillars remain, two of them at the entrance to the enclosure. The present shrine is said to have been built about 200 years ago by Chintamanrav Maharaj the second of the Chinchvad Devs. The temple consists of a hall or *mandap* with rows of wooden pillars and an outer and inner shrine. The outer shrine or antechamber is surmounted by a small spire and the inner shrine by a large spire both rough looking. The large spire rises in four tiers the lowest tier being the widest. Each of the three upper tiers is ornamented with a frieze. A small pot or *kalash* flanked by four minarets completes the spire. In front of the hall is a stone rat, the carrier of Ganpati. To the north of the temple is a corridor with fifteen arches in front, each arched compartment roofed by a low conical vault. The arcade is the gift of the Povar family. A flight of steps leads to the flat corridor roof which is a favourite place of resort during the large fair on *Ganeshchaturthi* in August-September when about 1000 people assemble. On the extreme west beyond the shrine and joined to it is a tiny shrine of Mahadev. The temple enjoys a yearly Government cash grant of about £161 (Es. 1610) and land assessed at £3 10s. 6d. (Rs. 35¼).

In 1751 Ranjangaon was plundered by the Moghals. [Grant Duff's Marathas, 276.] In 182 Captain Clunes notices Ranjangaon with 140 houses, nine shops several wells, and a rest-house. [Itinerary, 11.]

ROTI.

Roti, a small village seven miles north-east of Supe, with in 1881 a population of 229, has a temple of Tukai Devi built by the Medhe family. The temple is quadrangular and built of cut-stone. In honour of the goddess the Medhe family give a large feast to Brahmans twice a year, one on the full-moon of *Chaitra* or March-April and the other on the bright eighth of *Ashvin* or Sept.-Oct. A yearly fair is held at the temple on the bright ninth of *Magh* or Jan.-Feb.

SAKAR PATHAR.

Sa'kar Pa'tha'r, four and a half miles south of Lonavla station [Two other roads lead to Sakar Pathar both from Poona one fifty-three miles by Paud, Bhorkas, and Jambhulna, and the other about forty-five miles by the Bombay road.] is a raised plateau, 3000 feet above the sea or about 500 feet higher than Matheran (2460). The plateau is extensive [The plateau is large enough for hundreds of houses besides room for a racecourse and cricket ground. Mr. J. G. Moore, C. S.] and fairly wooded with good building sites on the west close to the edge of the Sahyadris, some of them commanding very fine views. At the back and to the east of the building sites is a nicely wooded ridge. The neighbourhood has beautiful walks and rides and the country to the south, along the edge of the Sahyadris, is mountainous and well wooded with good big game shooting. The water-supply is from a little lake on the plateau with a twenty-five feet high dam and an area of three acres. Allowing for evaporation and other losses the lake is calculated to hold about 3,000,000 gallons or 12,000 gallons a day for 250 days. In 1883, in sanctioning Sakar Pathar as a healthresort, Government observed that the creation of a new sanitarium in an accessible position like Sakar Pathar, near the line of rail and connected with it by a road passable for wheeled traffic, with a good climate, fair water-supply, and fine scenery, would be a great advantage to dwellers both in Bombay and in the Deccan. Leases were granted on the same terms as the Matheran and Mahabaleshvar leases. No applicant is to be allotted more than one site, and each is to be bound to build a house within three years or to forfeit his claim to the site. [Government Resolution, Revenue Department, 8569 of 21st November 1883.]

SASVAD.

Sa'svad, on the left bank of the Karha about sixteen miles south-east of Poona, is a municipal town, the head-quarters of the Purandhar sub-division, with in 1881 a population of 5684. Sasvad stands on the old Poona-Satara road by the Babdev and Diva passes. The 1872 census showed 6416 people of whom 6147 were Hindus and 269 Musalmans; and the 1881 census showed a decrease of 463 or 5684, of whom 5435 were Hindus and 249 Musalmans. A weekly market is held on Monday when the chief article of trade is grain from the villages round. Besides the sub-divisional revenue and police offices Sasvad has a municipality, dispensary, post-office, two old palaces, a mosque built entirely of Hemadpanti pillars and stones, and a temple. The municipality, which was established in 1879, had in 1882-83 an income of £271 (Rs.2710) and an expenditure of £253 (Rs. 2530). In 1883 the dispensary treated twenty in-patients and 5517 out-

patients at a cost of £70 12s. (Rs. 706). Sasvad was the original Deccan home of the Peshwa family. [Grant Duff's Marathas, 144. In 1713 Balaji, the first Peshwa, fled to Sasvad and here also he died in 1720. Ditto, 189, 209.] Outside of the town and across the river is the old Peshwas' palace which is now used as a Collector's bungalow and office. The palace bears marks of English shot. A large temple of Sangameshvar with steps leading to the river, stands on a small delta of land at the meeting of the Karha and one of its feeders. Round the chief temple are small shrines, tombs, and *sati* stones. Near the temple is the fortified palace of the Purandhare Brahman family, who were closely allied to the Peshwas for nearly a century. [Grant Duff's Marathas, 186.] In a revenue statement of about 1790 Saswer appears as the head of a subdivision in the Junnar *sarkar* with a revenue of £1765 (Rs. 17,650). [Waring's Marathas, 240.] In 1818 the palace for ten days withstood the attack of General Pritzler's division.

About 1840 the Amirs of Sind were confined in Sasvad. Though prisoners they were allowed to shoot and the neighbourhood of Sasvad was thoroughly cleared of wolves. [Murray's Bombay Handbook (New Edition), 193.] In 1837 Sasvad had a nursery garden.

SHAMBHUDEV HILL.

Shambhudev Hill is a detached height in the Bhima valley within the village limits of Bibi about twelve miles north-west of Khed. The hill is in the form of a truncated cone and is crowned by a temple of Shambhu. The holiness of the hill has left its sides a picturesque contrast to the surrounding barren heights. The temple is built within a quadrangle and has minutely carved wooden brackets over the pillars at the entrance to the hall or *mandap*. On a ledge above the *ling* are some wooden figures and the inside of the temple is painted by a Sonar with frescoes one of them a curious representation of a railway train with a Raja driver. [The origin of the Raja-driver railway train fresco may be the fact that His Highness Holkar, the former owner of the village, is fond of engine-driving. Mr. H. E. Winter, C. S.] Small fairs are held on the full-moon of *Chaitra* or March-April and on the Mondays of *Shravan* or July-August.

SHIVNE.

Shivne, a small village eight miles south of Khadkala, with in 1881 a population of 861, has a weekly market on Tuesday.

SINDE.

Sinde hamlet, close to Bhamboli in Khed, seven miles west of Chakan, has within its limits the hill of Bhamchandra with some old Buddhist caves. The hill rises steep from the plain on the south and west and has the caves in the southern scarp. A difficult climb leads to a cistern on the right which the villagers call Sita's Bath. A little further, after rounding a jutting neck, comes the chief cave of the group dedicated to Bhamchandra Mahadev. The cave is small and faces south-west, and has a cistern to its left. The entrance, which is eight feet high by thirteen wide with a small arched doorway in the centre, is closed. The cave is nearly square (15' x 14') and seven feet high with a flat roof.

Four pillars, two on either side, divide the cave into three parts. Each of the two compartments is adorned with a pilaster much like the pillars, and each has a niche with pillared jambs and canopy. In the middle are traces of a *daghoba* or a round base five feet in diameter within a square mark where it once stood. The umbrella is cut out of the roof. The pillars are massive and square but twice chamfered of halfway up so as to be octagonal. The capitals have massive projection on all four sides. In an inner shrine of the temple are a *ling* and a figure of Buddha or a Tirthankar. The figure is carved on a detached stone and may once have ornamented the *daghoba*. An elaborately sculptured doorway separates the inner from the outer cave. The doorway is two feet wide by four feet high with carvings chiefly of human figures. The cave has no horse-shoe arch or Buddhist rail ornaments. The soft rock of the hill has weathered away in places, and the screen or doorway dividing the two shrines has been cemented by the villagers to keep it in its place. Further on is a cell or cavern, and at some little distance in the middle of a difficult escarpment is a cave, at the end of which is a winding cavernous road, low and narrow, said to pass several miles into the hill. Higher up are one or two inaccessible caves, and beyond on the west is another small cave. The ministrant of Bhamchandra Mahadev enjoys land in Bhamboli village. [The late Mr. G. H. Johns, C. S.]

SINHGAD FORT.

Description.

Sinhgad or Kondhana fort, about twelve miles south-west of Poona, stands on one of the highest points of the Sinhgad-Bhuleshvar range 4322 feet above sea level and about 2300 feet above the Poona plain. Not far to the east of Sinhgad the range divides the main range running east to Bhuleshvar and a branch joined to Sinhgad by a high narrow ridge running south-east to Purandhar. On the north and south Sinhgad is a huge rugged mountain with a very steep ascent of nearly half a mile. From the slopes rises a great wall of black rock more than forty feet high, crowned by the nearly ruined fortifications of Sinhgad.

The fort is approached irregularly by pathways and regularly by two gates. The pathways, which are almost impassable except to the hillmen or Mavlis, are bounded by high and steep ridges on the east and south. The gates are on the north-east and south-east; the north-east or Poona gate is at the end of a winding ascent up the profile of a steep rocky spur; the easier Kalyan or Konkan gate stands at the end of a less difficult ascent guarded by three gateways all strongly fortified and each commanding the other. The ordinary mode of ascent to the fort is by sitting on a board hung by ropes to two bamboo poles and with a smaller board for a foot rest.

The fortifications, which consist of a strong stone wall flanked with towers, enclose a nearly triangular space about two miles round. Though generally triangular the summit is very irregular rising in many places within the walls into low rugged eminences.' [The greatest extent of the summit from east to west is about 3000 feet and about 2500 feet from north to south. Its irregular shape, which conforms to the direction of the scarped sides of the rock on which the walls stand, deprives it of a diagonal proportional to these

dimensions. Blacker's Maratha War, 240.] The north face of the fort is naturally very strong; the south face, which was easily taken by the English in 1818, is the weakest. The triangular plateau within the walls is used as a health-resort by the European residents of Poona in April and May, and has several bungalows. The plateau commands a splendid view on all sides.

History.

The earliest mention of the fort, which was known as Kondhana until in 1647 Shivaji changed its name to Sinhgad or the Lion's Fort, is in 1340 when the Delhi emperor Muhammad Tughlik (1325-1351) marched against it. Nag Naik, its Koli chieftain, opposed Muhammad with great bravery, but was forced to take refuge within the walls of the fort. As the only way to the hill top was by a narrow rock-cut passage, Muhammad, after fruitless attempts on the works, blockaded the fort. At the end of eight months, as their stores failed them, the garrison left the fort and Muhammad returned to Daulatabad. [Mackintosh in Transactions Bombay Geographical Society, 1.192 Briggs' Ferishta, 1.420.] In 1486 Kondhana appears among the Poona forts which fell to Malik Ahmad, the founder of the Ahmadnagar dynasty (1490-1608), on his capture of Shivner. [Briggs' Ferishta, III. 191.] In 1633 Jijibai the mother of Shivaji was taken prisoner by the Musalman governor of Trimbak, but released and conveyed to Kondhana. [Grant Duff's Marathas, 49.] As regent for the Ahmadnagar king Shahaji held Kondhana among other Poona forts. [Shahaji held Kondhana and Purandhar, being at the head of the government, as under the Muhammadan governments, these two forts were reserved by the king and never entrusted to *jagirdars*. Grant Duff's Marathas, 53 note 1.] When, in 1637, Shahaji, pursued by the Bijapur forces from Lohogad to Kondhana and from Kondhana to the Konkan, agreed to enter Bijapur service, he gave up five Poona forts of which Kondhana seems to have passed to Bijapur and the other four to the Moghals. [Elliot and Dowson, VII. 59 - 60; Grant Duff's Marathas, 53.] In 1647 Shivaji gained Kondhana by a large bribe to its Musalman commandant and changed its name to Sinhgad or the Lion's Den. [Grant Duff's Marathas, 60. Elliot and Dowson, VII. 270 - 271; Grant Duff's Marathas, 88.] In 1662 on the approach of a Moghal army under Shaiste Khan, Shivaji fled from Supa to Sinhgad, and from Sinhgad he made his celebrated surprise on Shaiste Khan's residence in Poona. He sent two Brahmans in advance to make preparations. One evening in April a little before sunset Shivaji set out from Sinhgad with a considerable body of foot soldiers. These he posted in small parties along the road, and took with him to Poona only Yesaji Khan, Tanaji Malusre, and twenty-five Mavlis. The Brahmans had won over some of the Marathas in Shaiste Khan's employ. They arranged that two parties of Marathas should enter the town, one as if a wedding party, the other as if bringing prisoners, and that Shivaji and his twenty-five Mavlis should pass in with them. Shivaji's party passed in safety, put on their armour, and at the dead of night, by secret ways, reached the Khan's house. The house was well known to Shivaji as it was the residence of his father's manager Dadaji Kondadev. They entered through the cook-house, killed the cooks, and as they were cutting through a built-up window the alarm was raised. Three of the Mavlis entered Shaiste Khan's room, but two fell into a cistern of water, and the third, though he cut off Shaiste Khan's thumb, was killed by his spear. Two slave girls dragged Shaiste Khan to a place of safety. The Maratha's killed many of his followers, cut to

pieces some of the women, and chopped off the head of an old man whom they took for Shaiste Khan. The kettledrums beat an alarm, and the Marathas retired, lighting torches and burning bonfires as they went up Singhad hill in derision of the Moghals. Next morning a body of Moghal horse galloped towards the fort. An unexpected fire of musketry threw them into confusion and they retired in disorder. A party of Shivaji's horse fell on them and they took to flight, the first time that Moghal cavalry were chased, by Marathas. A second attempt was made to invest Singhad, but the siege was not pressed. For some time after this Singhad continued to be Shivaji's head-quarters. In 1664, hearing of his father's death, Shivaji came to Singhad after the sack of Surat, and spent some days in performing his father's funeral rites. To Singhad he returned in November 1664, after plundering the town of Ahmadnagar, defeating the Bijapur troops with great slaughter, and sacking and burning Vengurla. [Grant Duff's Marathas, 88,89 - 90.] In April 1665 a fresh Moghal force invested Purandhar and blockaded Singhad, [Grant Duff's Marathas, 92 : Elliot and Dowson, VII. 272-273.] where were Shivaji's wife and his mother's relations. Finding their rescue impossible, as all the roads were blockaded, Shivaji sued for forgiveness from the Moghal general Raja Jaysing. Raja Jaysing accepted his offer of submission, the siege was stopped, 7000 persons men women and children came out of Singhad fort, and the Moghals took possession. [Elliot and Dowson, VII, 273.] In the treaty which followed Shivaji gave to Jaysing twenty of his thirty-two forts, among them Purandhar and Singhad with all their dependent districts. In 1666 Jaysing placed strong garrisons in Singhad, Lohogad, and Purandhar, but in December of the same year, after his escape from Delhi, Shivaji regained all these forts. In 1667 Shivaji obtained from Aurangzeb the title of Raja and his father's districts of Poona, Chakan, and Supa, but Singhad and Purandhar were kept by the Moghals. Shivaji resolved to take them, and his capture of Singhad in 1670 forms one of the most daring exploits in Maratha history.

As Singhad was commanded by a celebrated soldier Ude Ban with a choice Rajput garrison, it was deemed impregnable. Security had made the garrison somewhat negligent, and Shivaji formed a plan for surprising the fort. The enterprise was entrusted to Tanaji Malusre who offered to surprise Singhad if he was allowed to take his younger brother Suryaji and 1000 picked Mavlis. Accordingly, in February 1670, a thousand Mavlis under Tanaji and Suryaji set out from Raygad in Kolaba, and, taking different paths, met near Singhad on the night of the dark ninth of *Magh*. Tanaji divided his men into two parties. One party under his brother Suryaji he left at a little distance with orders to advance if necessary; the other party under his own command lodged themselves undiscovered at the foot of Singhad rock. When it grew dark, choosing the sheer southwest gorge as the part least likely to be guarded, one of the Mavlis climbed the rock and made fast a rope ladder up which the rest crept one by one. Each, as he gained the top, lay down. [The old people of Singhad fort say that the rope was taken by a large lizard or *ghorpad*, who also dragged up tanaji who made fast the rope and enabled the Mavlis to climb up. Mr. J. McL. Campbell, C. S.] In spite of their care, before 300 of them had reached the top, some movement alarmed the garrison. One of them drew near, but was silently slain by an arrow. Still the alarm spread, and the noise of voices and of a running to arms showed Tanaji that a rush forward was his only chance of surprise. The Mavlis plied their arrows in the direction of the voices, till a blaze of blue lights and

torches showed the Rajputs armed or arming and discovered their assailants. In the desperate fight that followed Tanaji fell. The Mavlis lost heart and were beating a retreat to the ladder when Suryaji, Tanaji's brother, met them with the reserve. He rallied them, asked them if they would leave their leader's body to be tossed into a pit by Mhars, told them the ropes were broken, and there was no retreat; now was the time to prove themselves Shivaji's Mavlis. They turned with spirit and, shouting their war-cry, ' Har Har, Mahadev,' dashed on the garrison, and, after a desperate fight in which 300 Mavlis and 500 Rajputs were slain or disabled, gained the fort. Besides those who were slain or wounded in the fort, many Rajputs who ventured over the crest of the rock were dashed to pieces. [The tombs of Tanaji and Ude Ban the Rajput commandant lie 150 yards apart near the north-west corner of the fort. Ude Ban is revered as a saint or *pir*.] A thatched house turned into a bonfire flashed the news to Shivaji in Raygad fort in Kolaba about thirty miles west of Singhad. Contrary to his custom, Shivaji gave each of the assailants a silver bracelet and honoured their leaders with rich rewards. He grieved over Tanaji and said, playing on the name of the fort, Singhad, the lion's fort, is taken but the lion is slain; I have gained a fort and lost Tanaji. Suryaji was made commandant of Singhad, [Grant Duffs Marathas, 108-109.] and a high masonry wall was built across the top of the gorge which the Mavlis had scaled. In 1685 Aurangzeb ordered posts or *thanas* to be placed in the country between Junnar and Singhad. In February 1700 Rajarani, the second son of Shivaji, took shelter in Singhad and died a month later. Between 1701 and 1703 Aurangzeb besieged Singhad. After a three and a half months' siege the fort was bought from the commandant and its name changed to Bakshindabaksh or God's Gift. In 1706, as soon as the Moghal troops marched from Poona to Bijapur, Shankraji Narayan Sachiv chief manager of the country round, retook Singhad and other places. The loss of Singhad was a great grief to Aurangzeb and aggravated the illness of which in the next year he died. He sent Zulfikar Khan to take Singhad. The garrison yielded from want of supplies but as soon as Zulfikar retired, from the same cause the hill was speedily retaken by Shankraji Narayan. [Grant Duffs Marathas, 180-181.] In 1750 Tarabai, the grand mother and keeper of the prisoner chief of Satara, on pretence of paying her devotions at her husband Rajaram's tomb in Singhad, endeavoured to persuade the Pant Sachiv to declare for her as head of the Maratha empire. [Grant Duff's Marthas, 270.] In 1750 Balaji Peshwa arranged that the Pant Sachiv should give him Singhad in exchange for the forts of Tung and Tikona in the Bhore state. [Grant Duff's Marthas, 272.] On his defeat by Yashwantrao Holkar at the battle of Poona on the 25th of October 1802, Bajirao Peshwa fled to Singhad. From Singhad, where he remained three days, Bajirao sent an engagement to Colonel, afterwards Sir Barry, Close the British Resident, binding himself to subsidise six battalions of sepoys and to cede £250,000 (Rs. 25 lakhs) of yearly revenue for their support. In May 1817 when Mr. Elphinstone found Bajirao levying troops he warned him of his danger and told him that unless Trimbakji Denglia, the murderer of Gangadhar Shastri, was given up or driven out of the Peshwa's territory, war with the English must follow. Some days passed without any answer from Bajirao and then Mr. Elphinstone formally demanded the surrender of Trimbakji within a month and the immediate delivery of Singhad, Purandhar, and Raygad as a pledge that Trimbakji would be surrendered. On the 7th of May Mr. Elphinstone threatened to surround Poona if Singhad and the other two forts were not given up in pledge of Trimbakji's surrender, and, at the last moment, at daybreak on the 9th of May, when troops were already moving

round the city, Bajirav issued an order for the surrender of the forts. The forts remained in British charge till August, when, as the Peshwa agreed to the treaty of Poona (13th June 1817), they were restored to him. [Grant Duff's Marathas, 558, 634, 646.] After the battle of Kirkee (5th November), the Marathas placed some guns under the protection of Sinhgad, but, on the 18th of November, a detachment sent by General Smith brought away fifteen of them without loss. [Pendhari and Maratha War Papers, 129.] Sinhgad remained with the Marathas till the 2nd of March 1818 when it surrendered to General Pritzler. On the 14th of February General Pritzler marched from Satara and came by the Nira bridge to Sinhgad. The march was accomplished without any molestation though the line of march with the train stores and provisions stretched four miles and the latter part of the road lay among hills with numerous ravines. The siege of Sinhgad was begun on the 24th of February. The head-quarters of the force were established near a stream about two and a half miles south-east of the fort, probably near the village of Kalyan. As one of the avenues from the Poona gate on the east communicated with the northern valley, six companies of the second battalion of the 7th Bombay Native Infantry and a body of auxiliary horse, invested it on that side near Donje village. On the crest of the ridge, opposite that extremity, at the distance of 800 yards, a post and battery of one eight-inch mortar, one five and a half inch howitzer, and two six-pounders were established. The battery opened on the 21st. On the 22nd four companies of the 2nd battalion of the 15th Madras Native Infantry marched for Poona and were replaced by the remaining four companies of the 2nd battalion of the 7th Bombay Native Infantry. The mortar battery, which opened on the evening of the 22nd and consisted of one ten and three eight-inch mortars and three five and a half inch howitzers, was placed under cover of a hill southeast of the fort. On the 24th, Captain Davies with 1800 Nizam's reformed horse joined Major Shouldham's post in the northern valley from which two six-pounders were ordered to Poona. Opposite the south-west angle, about 1000 yards off a battery of two twelve-pounders and two six-pounders was established and opened on the 25th of February. To the right of this battery, 700 and 1000 yards from the gate, two breaching batteries, each of two eighteen-pounders, opened on the 28th against that point. By the 1st of March, after 1417 shells and 2281 eight-pounder shots had been fired, the garrison of 1200 men, 700 of them Gosavis and 400 Arabs, hung out a white flag. The garrison were allowed to march out on the 2nd of March with their personal arms and private property. The garrison engaged to proceed to Elichpur in Berar accompanied by a guard from the British Government, and to bind themselves by giving hostages not to enter into the service of any native state[Blacker's Maratha War, 239-241; Pendhari and Maratha War Papers, 240,] Forty-two guns twenty-five wall pieces, and a quantity of powder and shot, were found in the fort. Prize property to a vast amount, consisting of pearls and diamonds said to have been removed there for safety by Poona merchants, was found in Sinhgad. Many of the soldiers carried about for several days hats full of pearls jewels and gold ornaments for sale without knowing their value being anxious to exchange them for money or exchange bills on Bombay ere the prize agents should discuss the plunder. [Fifteen Years in India, 490.] Along with other treasure a golden image of Ganesh was found hidden in a masonry pillar in Sinhgad fort. It was said to be worth £50,000 (Rs. 5 lakhs) and a ransom of £15,000 (Rs. 1,50,000) was offered for it. [Bombay Courier, 21st March 1818. This image is probably referred to in Pandurang Hari (p. 45 note) where it is said to have had diamonds for eyes and been studded with jewels and valued at £5000

(Rs. 50,000). So in July 1818, with jewels and other property of Bajirav Peshwa, a gold image of Vishnu was found at Nasik. It was made in 1707 and weighed 370 rupees weight. It was taken by Bajira with him in all his wanderings in a state palanquin. It came to Nasik in the Maratha war here it was discovered by the British and sent to Poona. Higginbotham's Asiatic Journal Selections, 364-365.] In 1818 Babaji Pant Gokhle, one of the murderers of the brothers Vaughan at Talegaon; was confined by Mr. Elphinstone in Sinhgad where he died in 1835[Grant Duff's Marathas, 654 note 2; Deccan Scenes, 46.] In 1862 the fort was described as ruinous with crumbling walls and gates in disrepair. The fort was able to hold about 1000 men and had ample water with supplies from the neighbouring villages of Donje and Peth Shivapur. [Government Lists of Civil Forts (1862),]

SIRUR.

Sirur or **Ghodnadi**, [Ghodnadi is the local name. It is called Sirur as it lies within the limits of Sirur village two miles, to the north-west.] on the right bank of the Ghod about forty miles north-east of Poona, is a municipal town, the head-quarters of the Sirur sub-division, with in 1881 a population of 6325. Sirur is in the extreme west of the sub-division and displaced Pabal in 1867 on its transfer from the Ahmadnagar district. Sirur has about 285 money lenders traders and shopkeepers, some of whom are rich. They trade in cloth and grain. At the weekly market on Saturday large numbers of cattle and horses are sold. Besides the revenue and police offices of the Sirur sub-division the town has a municipality, a travellers' bungalow, and a post-office. The municipality was established in 1868 and in 1882-83 had an income of £678 (Rs. 6780) and an expenditure of £512 (Rs. 5120). As early as the beginning of the present century its healthy situation on the Ghod, midway on the main road between Poona and Ahmadnagar, marked out Sirur as a suitable site for a cantonment. The station is about 1750 feet above the sea, and the country round is hilly and uncultivated. Hills rise in a succession of ranges one above the other, stretching for a long distance along the north bank of the Ghod. Along the south bank, where the station stands, the country is more regular with occasional hills and little forest land. Sirur was occupied in 1803. The station has a good supply of forage and is barely more than one march (thirty-nine miles) from Poona. The garrison of Sirur consists of the Poona Auxiliary Horse[The Poona Horse was raised in 1817, The article of the Bassein treaty of 1802 which obliged the Peshwa to maintain a cavalry force was annulled and this corps was substituted. Grant Duffs Marathas, 566, 645.] living in neat regimental lines.

Colonel Wallace's Tomb,(1809).

About a third of a mile from the town, a mile from the cantonment, and a little to the north-west of the parade ground, is the graveyard with several obelisks and monuments. The most notable monument is Colonel Wallace's tomb, a fluted column about fifteen feet high on a three-stepped masonry base. [The details are: A masonry base 14' 2" by 12' 1½ " with three steps, the first 11' 6" by 9'6", the second 10' by 8", and the third 6' by 6" square. The column is 15' 4" high, 9' 6" round the middle, and 14' round the base. The American Mission Catechist, Sirur.] On the pedestal is a marble tablet with these words:

Sacred to the memory of Col. William Wallace of His Majesty's 74th Regiment of Foot and Commander of the Force subsidised by His Highness the Peshwa. A man respected and beloved for his Gallantry, Devoted Public Zeal, Ardent Honourable Rectitude, and Noble Candour. He died at Sirur on the 11th of May 1809 aged 47 years.

This seems to be the Colonel Wallace of whom, as Brigadier of the trenches at the siege of Gavilgad (7th-15th December 1803) in the Second Maratha War, the following story is told. Some guns had to be taken by night to a high and difficult position on the hill. The officer in charge came to Colonel Wallace and reported that it was impossible to take the guns. Colonel Wallace called for a light and drawing his papers out of his pocket said: 'Impossible, it can't be impossible, here it is in the orders.' [Welsh's Military Reminiscences, 1.196; Colebrooke's Elphinstone, I. 86 -109.] It is interesting that a man of so admirable a spirit, and, as his epitaph seems to show, of so noble a life should still be remembered by the aged at Sirur as *Sat Purush* the Holy Man, and that his tomb, which he wisely endowed, should still be worshipped. Colonel Wallace is the guardian of Sirur. Thursday is his great day and Sunday also is lucky. Vows offered to get rid of barrenness and other spirit-sent ailments never fail and newly married pairs are brought to Colonel Wallace, as they are brought to Maruti, that his guardian power may drive evil, that is evil spirits, from them. Except Brahmans and Marwaris all Hindus of Sirur and the neighbouring villages, chiefly Kamathis, Kunbis, Malis, Mhars, and Mangs, worship at Wallace's tomb. People, whose wishes have been fulfilled or who have been freed from diseases, offer incense, lay flowers before the tomb, and distribute cocoanuts, sweetmeats, or coarse sugar. Sometimes Kamathis and other flesh-eaters perform a ceremony called *kanduri*, when a goat is killed outside of the graveyard and the body brought in, offered at the tomb, and eaten by the ministrant. The ministrant, Dulaba, who is the son of the original pensioner, Colonel Wallace's groom, gets the offerings. At harvest time the villagers bring him first fruits of grain as *naivedya* or food for the saintly spirit. The Colonel's ghost still sometimes walks on no-moon and on full-moon nights. [It is said that the ease with which he reduced some of the strongest forts in the Deccan caused Colonel Wallace to be regarded with great awe by the people as one, with supernatural powers. Whenever a public calamity is about to occur the ghost of Wallace Saheb is seen restless and wandering about the limits of the camp. Unless ceremonies are performed at the tomb to appease his spirit and avert impending danger, the most dreadful consequences are sure to follow. Life in Bombay' (1852), 282.] About ten years after Colonel Wallace died General Smith tried to stop the yearly endowment of 18s. (Rs. 9). Colonel Wallace's ghost came and troubled him, and General Smith gave back to Dulaba's father the 18s. (Rs. 9) a year and set him in charge of the whole graveyard. Between 1840 and 1850 the Rev. Mr. French tried to stop the worship. It still goes on. At least one *kanduri* or goat-offering took place in 1883 and on the 24th of June 1884 cocoanuts had lately been offered at the tomb. [Details supplied chiefly by Dulaba through the American Mission Catechist Sirur.]

[SUPE.](#)

Supe, on the Ahmadnagar-Satara road thirty-six miles south-east of Poona, is the headquarters of the Bhimthadi sub-division, with in 1872 a population of 4979 and in 1881 of 4507. Besides the sub-divisional revenue and police offices Supe has a post-office, a Wednesday market, a mosque and a Musalman tomb, and a temple.

Mosque.

The mosque, which is an old Hemadpanti temple of Mahadev, is said to have been built by Aurangzeb (1658-1707). It is on a Plinth three feet high, the pillars rising nine feet from the plinth. It has forty pillars sixteen of them embedded in the back and side walls and twenty-four open. Some of them are carved only in one face and seem to have been pilasters in the Hemadpanti temple. Long beam-like stones are laid on the pillar capitals and the squares thus formed are domed in the usual cut-corner Hemadpanti style. The Musalman tomb, which is outside of the town, belongs to Shah Mansur, an Arab who is said to have come to Supe about 1380 and to have buried himself alive. Beside the tomb is a mosque and rest-house which is locally believed to have been built by the emperor Akbar (1556-1605). In a square enclosure raised on a plinth of squared stones opposite to the gate on the south is the tomb, on the west the mosque and another building said to be a place of assembly flanking the mosque on the east. The rest of the area is a paved court. The tomb and mosque are whitewashed and are daubed all over with the impression of an open hand smeared with reddish brown. [The hand is lucky or spirit-scaring both among Hindus and Musalmans. The Hindus have the *sati's* or widow sacrifice's hand on her tombstone, and in Gujarat painted in red on the town gates. Musalmans both Shias and Sunnia worship a hand or *panja*. The Sunnis say it represents the Prophet Muhammad and the four Kaliphas; the Shias say it is the Prophet Ali and his four grandsons. At Musalman weddings the parting guests are saluted by a red hand being slapped on their white coated shoulders. In Bombay (May 1884) a Bhatia's house during the house-warming had the whole front painted with hands. As in the Jewish patriarchal blessing and the Christian laying on of hands the basis of the holiness of the hand seems to be that it is the outlet through which the spirit of blessing passes.]

Inscriptions.

The mosque has four small inscriptions in Persian which may be translated: (1) In the name of the most Merciful God, Muhammad, Husain, Hasain, Ali; (2) There is no God but One, and Muhammad is His Prophet; (3) The foundation of the shrine of Mansur, Araf (the knower of God) laid in the year H. 1108 (A.D. 1695); (4) This is the shrine of Latif Sha'h.

A large fair is held at the *dargha* about October. [Grant Duff's Marathas, 41.] Supe has another tomb of a Brahman who was converted in Aurangzeb's time. The temple of Tukobadev was built by one Annajirav Marathe.

About 1604 the district of Supe with Poona and two forts were granted as an estate to Maloji Bhonsle the grandfather of Shivaji by Murtaza Nizam Shah II. (1599-1631) of Ahmadnagar. [Grant Duff's Marathas, 41.]. Malojis son Shahaji appointed Baji Mohite,

the brother of his second wife, as manager of Supe. During his father's absence in the Karnatak Shivaji tried to induce Baji Mohite to hand him over the revenues of Supe. Baji, who held 300 horse, sent civil answers to Shivaji, but refused to pay the revenue without the knowledge and consent of Shahaji. Shivaji baffled by peaceful means resorted to arms. He surrounded Supe at dead of night and took Baji prisoner. [Grant Duff's Marathas, 60-61.] In a revenue statement of about 1790 Supa appears as the head of a *pargana* in the Juner *sarkar* with a revenue of £7582 (Rs. 75,820). [Waring's Marathas, 240.]

TAKVE BUDRUKH.

Ta'kve Budruk, a small market village on the Andra a feeder of the Indrayani, four miles north-east of Khadkala, with in 1881 a population of 694, has a temple of Vithoba in whose honour a yearly fair or *jatra* attended by 1000 people is held on the fifth of the bright half of *Magh* or January-February. It has a dry weather Monday market.

TALEGAON DABHADE.

Talegaon Da'bha'de, in Maval about ten miles south-east of Khadkala and about twenty miles north-west of Poona is a municipal town with a railway station, and had in 1881 a population of 4900. Talegaon is a half alienated village belonging to the Dabhade family. It has a large pond with temples and tombs, a dispensary, a girls' school, and a large oil industry. The 1872 census showed a population of 5040 of whom 4585 were Hindus, 450 Musalmans, and five Christians. The 1881 census showed a decrease of 140 or 4900, of whom 4410 were Hindus, 485 Musalmans, and five Christians. The 1883 railway returns showed 132,645 passengers and 13,060 tons of goods. The municipality was established in 1866 and had in 1882-83 an income of £245 (Rs. 2450) and an expenditure of £139 (Rs. 1390). The dispensary was opened in 1876 and in 1883 treated ten in-patients and 5609 out-patients at a cost of £66 (Rs. 660).

To the south of the town is a reservoir which has been improved and built round by successive generations of Dabhades, and some small temples of Mahadev line its northern bank. The water in this reservoir and also in existing wells is unfit to drink. Arrangements have therefore been made for building a reservoir to the west of the town which will provide an ample supply of pure drinking water. [Mr. J. G. Moore, C.S.] To the north of the town in a thick grove is an old temple of Vaneshvar or the Forest God. In front is the bull under a canopy and behind the bull is a square cistern with flights of steps leading to the water. The temple has a battlemented cornice with three small minarets over the entrance. The dome or *Shikaar* over the shrine resemblance the dome of Siddheshwar temple in Khed and has similar snake ornaments. On either side of the temple in enclosed spaces are the tombs or *chhatris* of the Dabhade family, raised platforms, each supporting a tiny shrine, built over the spots where the Dabhades were burnt.

History.

The Dabhade family rose to importance, in the reign of the first Peshwa Balaji Vishvanath (1714-1720). Its founder was Khanderav Dabhade who was appointed commander-in-chief or *senapati* in 1716. [Grant Duff's Marathas, 196-197.] In 1721 Khanderav died and was succeeded in his command by his son Trimbakrav Dabhade. [Grant Duff's Marathas, 209.] Trimbakrav was an instrument in the hands of Nizam-ul-Mulk who was always ready to thwart the aims of Bajirav I. (1721 - 1740). Bajirav suspected this and when he heard of Dabhade's preparations against the Deccan in 1731, aided by the Nizam, he marched to Gujarat with a small force, met and killed Dabhade and completely routed his force. The victory led to a bitter feud between Bajirav and the Dabhade family. For several days every year the Dabhades used to feed a thousand Brahmans at Talegaon. After the defeat Bajirav continued the practice at Poona and distributed sums of money to learned men. This was the origin of the Dakshina grant which has been continued by the British Government under the form of college fellowships and encouragement of vernacular literature. [Grant Duff's Marathas, 224-225. See above pp. 48, 60-62.] In 1779 Talegaon was the furthest point reached by the English army which came to restore Raghunathrav as Peshwa and made the capitulation of Vadgaon about three miles to the west. On the 9th of January 1779, after a short advance, the Maratha army retired under orders from Nana Fadnavis, and set fire to the village of Talegaon. The English feared that Poona and Chinchvad would be burnt in the same way, and instead of advancing to Poona which was only eighteen miles off, in spite of Raghunathrav's advice, they determined to return to Bombay. On the 11th of January the army of 2600 British troops threw their heavy guns into the large Talegaon pond, and burning their stores left Talegaon at dead of night. [Grant Duff's Marathas, 414-416.] In 1817, five days after the battle of Kirkee, two brothers of the name of Vaughan, one of them a Major, in the 15th Madras Native Infantry and his brother in the Marine service, while on their way from Bombay to Poona, were seized at Talegaon and, in spite of their remonstrances and the offer of a ransom, were hanged to a tree by the roadside on the 10th of November. Their graves side by side are about twenty yards off the road. [Fitz Clarence's Journey, 314. It is said that the brothers were first captured Karle, dragged almost naked to Talegaon, and one brother was made to hang other. Fifteen Years in India, 481; Grant Duff's Marathas, 654.] About this side Talegaon is described as a town with a remarkably fine pond and a mango grove. In 1827 Captain Clunes notices Talegaon with 1500 houses, the thief town of the Dhabbar's (Dabhades). [Itinerary, 10.]

[TALEGAON DHAMDHERE.](#)

Talegaon Dhamdhere [The town takes its name probably as it was a convenient halting place or camping ground, *tal*. The late Mr. G. H. Johns, C. S. It is called Dhamdhere after the Dhamdhere family who live in it to distinguish it from Talegaon Dabhade to Maval.] on the Vel river about twenty miles south-west of Sirur is a municipal and market town, with in 1881 a population of 3620. The weekly market is held on Monday. Besides the municipality the town has a sub-judge's court, a post-office, and a dispensary. The municipality was established in 1855 and in 1882-83 had an income of £70 (Rs. 700) and an expenditure of £49 (Rs. 490). The dispensary dates from 1876. In 1883 it treated four in-patients and 4724 out-patients at a cost of £57 (Rs. 570).

Temples.

The town has several temples the chief of which are five of Ganpati, Nath, Siddheshvar, Takleshvar, and Uttareshvar. Ganpati's temple was built by a member of the Dhamdhere family. The temple porch is entered on the east and south through large arched openings and has a vaulted roof. The spire is profusely adorned with quaint little figures in niches. Nath's shrine, dedicated to an ascetic of that name, is built on the river bank. Nath is said to have lived in Shivaji's time and to have been a friend of a Musalman saint Itnak Bawa whose tomb is in the Musalman graveyard to the northeast of the town. [According to a local story Nath and Itnak spent their spare time in playing cards.] A fair, attended by about 3000 people, is held on *Mahashivratra* in February-March. The shrine enjoys rent-free land assessed at £4 18s. (Rs. 49). Siddheshvar's is a large shrine built on raised ground and enclosed by lofty battlemented walls. High flights of steps lead on the east and west into the temple enclosure. The temple is said to have been built by a village accountant of Talegaon who rose to be Sindia's minister. Takleshvar's temple is an old building to the west of Ganpati's shrine. The temple is entered through a curious old rest-house which opens into the market place. Uttareshvar's temple was built by a member of a family called the Mahajans about 200 years ago. To the north of the temple is a fine well and an old lamp-pillar outside the enclosure. Besides these five shrines, outside the town about half a mile to the north-west, is a temple of Bhairav, a quaint old structure enclosed by walls. Its hall or *mandap* is divided into three small aisles by two rows of low stone pillars supporting brick arches. In 1751 Talegaon Dhamdhere was totally destroyed by the Moghals. [Grant Duff's Marathas, 276.]

THEUR.

Theur, a small village of 1034 people in Haveli about thirteen miles west of Poona, has a temple of Ganpati, the chief part of which was built by Chintaman, the second *dev* or man-Ganpati of Chinchvad, at a cost of £4000 (Rs- 40,000). About a hundred years after, nine verandas or galleries were added to the main building at a cost of £4000 (Rs. 40,000) by Madhavrav the fourth Peshwa (1761-1772). The temple is built of cut-stone and consists of a large audience hall or *mandap* with verandas on either side. The external wooden posts were put in by Haripant Phadke a Maratha general. Three more verandas were added to the south of the temple at a cost of £300 (Rs. 3000) by one Bachajipant. In the temple enclosure is a small shrine of Vishnu and a rest-house built by Gandopant a Maratha havildar. Not far from the temple and in the same enclosure is a sacred fig tree for which a plinth was built by Ramabai the wife of Madhavrav Peshwa. The temple of Ganpati enjoys a yearly grant of £208 16s. (Rs. 2088) paid to Shri Chintaman Ganpat Dev of Chinchvad who manages the temple. The temple enjoys two other minor Government grants of £185 6s. (Rs. 1853) for drum-beating and of £1 12s. (Rs. 16) for lighting. Theur was a favourite resort of Madhavrav the fourth Peshwa who died here on the morning of the 18th of November 1772 in the twenty-eighth year of his age. [Grant Duff's Marathas, 352.]

TULAPUR.

Tula'pur in Haveli at the meeting of the Bhima and the Indrayani is a small village of 351 people about sixteen miles north-east of Poona. The village was originally called Nagargaon, but is said to have been called Tulapur or the Weighing Town to commemorate Shahaji's plan of weighing an elephant of the Bijapur general Morarpant, by placing him in a boat, marking the draught of water removing the elephant, replacing his weight with stones and weighing them. [Grant Duff's *Marathas*, 159 note 1. Compare Falkland's *Chow Chow*, I. 307-308, where the same story is given of Aurangzeb and a ferryman.] In August 1689 Tulapur was the site of Anrangzeb's camp where Sambhaji and his favourite Kalusha were executed. [Grant Duff's *Marathas*, 159-160. Compare Part II. pp. 238-239.]

URULI.

Uruli, a small village eighteen miles east of Poona, with in 1881 a population of 1587, has a station on the Peninsula railway which is at present the nearest station to the famous temple of Jejuri twelve miles to the south. The 1880 railway returns showed 20,819 passengers and 783 tons of goods. In 1817 Cornets Hunter and Morrison two English officers on the Madras establishment, on their way from Haidarabad to Poona with a small escort, were caught at Uruli. On being waylaid the two officers, whose escort consisted of one havaldar and twelve sepoy, took post in a rest-house and made a breastwork of their baggage. They defended themselves with courage for several hours and did not surrender till their ammunition was spent and the enemy had climbed to the top of the building and was firing on them through holes in the roof. It is worthy of mention, that, though before the attack the officers were offered a safe conduct to the British camp at Poona, they declined to avail themselves of an advantage in which their followers could not share. [Bombay Courier, 16th May 1818. In a general order by the commander in chief, dated Sunday, 11th January 1818, the capture of these two officers is thus alluded to: "This occurrence, while it evinces what may be done, even with a handful of disciplined troops, over a numerous irregular enemy, shows also the injury the public service may suffer at any critical moment by a failure of ammunition. His Excellency embraces this opportunity to order that no guard shall in failure be detached from its corps on any service beyond the frontier without its full amount of spare ammunition, the want of which in the instance above described has forced two brave young officers to surrender in a situation where perhaps they might have maintained themselves until relieved. The loss of the enemy was more than four times the original number of this small party and the commander-in chief desires that his approbation may be expressed to the sepoy who have survived. He has also to express his hope that Cornets Hunter and Morrison may, at no distant date, be restored to liberty and the service, an object which His Excellency will not fail to endeavour by every means to accomplish." *Madras Government Gazette* quoted in the Bombay Courier of 16th May 1818.] From Uruli the two officers were taken to Poona. In a letter dated 9th November 1817 they stated that though rather roughly used at first they had been well treated since their arrival at Poona. Between December and January they were carried on cots from Poona to Kangori fort about eleven miles south-east of Mahad in Kolaba. At first they were offered *nachni* bread but refused it. They were then offered rice and refused it also, when they were allowed wheat bread and a fowl a day. Some time after they were

observed coming down the hill on foot under a strong guard. When they had reached the bottom, they were put into litters and carried to a fort about eight miles from Kangori, probably on the way to Vasota fort forty miles south-east of Satara. At Vasota the commandant fed them well, but so close was their confinement, that, till a shell burst over the roof of their prison during the British siege of the fort in April 1818, they had no idea that the English were near, nor till the commandant had decided to surrender, did they know the name of the fort in which they were confined. Before the British took possession, the two officers were allowed to show themselves on the walls, and were greeted by the Europeans of the mortar battery with three cheers. [Bombay Courier, 18th April 1818; Grant Duff's Marathas, 677-678.]

VADGAON.

Vadgaon, on the right bank of the Ghod thirteen miles north of Khed, is a large village with in 1881 a population of 1140. The village has a modern temple of Ramchandra enclosed by high walls. The roof of the hall or *mandap* is elaborately painted with scenes from the Ramayan. The spire is conical ending in a spike and round the base is a row of little domes.

VADGAON.

Vadgaon in Maval three miles west of Talegaon Dabhade and three miles east of Khadkala, is a large village with a railway station twenty-three miles north-west of Poona, a sub-judge's court, a weekly market, and a population in 1881 of 1348. The 1880 railway returns showed 6841 passengers and no goods. The weekly market is held on Tuesday. The village has a temple of Potobadev with a yearly fair attended by about 1000 on the full-moon of *Chaitra* or March-April. The temple enjoys a grant of rent-free land assessed at £1 1s. (Rs. 10½). Near the temple is a small pond. Vadgaon is the scene of the disgraceful convention of Vadgaon where in 1778-79 the commanders of the English army, which had been sent to restore Raghunathrav to the Peshwaship, agreed to give up to the Marathas all the British conquests since 1773 as the price of being allowed to retreat. [Details are given under History, Part II. 263-266.]

VAPHGAON.

Va'phgaon, eight miles east of Khed, with in 1881 a population of 1837, has a weekly market on Tuesday.

VADE.

Va'de, a large market town on the Bhima, twelve miles north-west of Khed, with in 1881 a population of 2758, is held in *inam* by the Dikshit family, and is connected with Khed by a good local fund road. It had a municipality which at the request of the townspeople was abolished in 1872. The only object of interest is a temple of Ram in memory of whose birth a yearly festival takes place on Ram's Ninth or *Ramnavmi* in *Chaitra* or March-April. The town has a Saturday market.

VALHE.

Va'lhe in Purandhar about fifteen miles south-east of Sasvad is a large market town with in 1881 a population of 3626. Valhe has a post-office and a weekly market held on Tuesday. According to a Maratha legend Valhe was the residence of Valmiki the author of the Ramayan. Valmiki is said to have been a Koli and his popular designation in songs and folklore is Valhya Koli. [Grant Duff's Marathas, 11.]

VEHARGAON OR KARLE CAVES.

The great **Veha'rgaon** or **Ka'rle** rock temple lies within the limits of Vehargaon village, about two miles north of the village of Karle thirty-five miles north-west of Poona and about 400 feet above the plain or one-third of the way up the hill sides which form the north wall of the Indrayani valley. From the open ground in front of the temple the flat rice-lands of the Indrayani valley stretch to the south and east sprinkled with trees and broken by deep wooded knolls. Across the valley rises a broken row of steep picturesque hills, the gaps between them filled by the peaks of more distant ranges. The rounded hill most to the east is Kudava, the pointed peak to the west of it Badrasi, then a pair of forts the flat top of Visapur to the east, and to the west the rounded head of Lohogad with the long spur of the Scorpion's Sting. Then a gap in the front range shows the distant peak of Tung and further west stretches the flat plateau of Sakarpathar with in the distance the lofty rugged outline of the Morgiri or Jambhulni hills.

Ekvira's Temple

The first building at the mouth of the great rock temple is the small stone tomb or *samadhi* of some modern ascetic. Further on a stone archway with a music room [The musicians are Poona barbers or Nhavis who state that Ekvira's shrine was endowed with a band of musicians by one of the Peshwas about four generations ago. There are eleven men two of them bandmasters or *jamadars* among whom a montly allowance of £4 19s. 3d. (Rs. 49 5/8) is shared. They play four times a day, at midnight, daybreak, noon, and sunset. The instruments are two big-brass drums called *naubats* or *nagaras* and two small iron drums or *jils*, two brass trumpets, a bigger *Karna* and a smaller *ture*, and a brass gong struck by a wooden mallet, a pair of cymbals made of *kase* or bellmetal, and two wooden pipes or *sanais*.] overhead leads on the right to Ekvira's temple a small bombed building on a high plinth of cut-stone. An inscription on the west wall states that it was built in February 1866 (Maha-Shud 5, S. 1788). [The inscription runs: Shri Ekviri Bhavani's old temple built for religious sake by Naga Posu Varlikar and Harippa Charnavir, Fajandar of Bombay, in consultation with Baburav Kulkarni on Maha Shud 5th, S. 1788 (February - March, 1866).] According to the local story an older temple stood for four generations on the same site. The people know that the worship of the goddess dates from much earlier times. They do not know whether it is older than the Pandavs and the great rock temple. At the top of the steps that lead to the plinth stands an iron arch hung with a row of nine bells Most of the bells are of native make, but the largest, a very sweet-toned bell, is English and bears the date 1857. All of them have been presented to Ekvira by Thana Kolis and Prabhus. [The large central bell has a

roughly cut inscription stating that it was given to Shri Bhavani Devi by Bandhanar Jivan Padam Koli and Dhondu Koli Thankar on *Chaitra Shud Ashtami* S. 1790 (April 1868).]

Inside of the doorway, the main hall of the temple is paved with stone and has a domed roof from which hang two rows of lamps and glass coloured balls. On the walls are some modern coloured paintings of Devi. Opposite the entrance is the shrine door with an arched blackwood frame and pannelling of thin open brass bars. Inside on a low four footed brass table stand the brass vessels that are used in the temple service and a small brass pillar on which a lighted oil saucer burns night and day. Cut in the rock behind the worship vessels is the image of Ekvira a human face so distorted by layers of redlead that the cheek-bones stand out almost to the level of the nose-bridge and the mouth seems sunk like the toothless jaws of an old woman. The eyes, which are of silver the white covered with white enamel or *mina* and the pupils with black enamel, have a wild inward squint. The shoulders are draped in a robe and bodice, of which the goddess has five or six sets, some of them plain and others rich with gold thread and silk. She has also earrings, silver for every-day wear and gold for high days, a pearl nosering, two necklaces of gold sequins, and two masks one of gold the other of silver, which she wears during her great festival time in March and April (*Chaitra shud Ashtami and Purnima*).

The temple funds are managed by a council or *panch*, and a ministrant or *pujari*. A Karhada Brahman, with a yearly salary of £6 17s. (Rs. 68½), waits on the goddess for two hours every morning. According to the local story this endowment and the appointment of ministrant were given to the family of the present holder by Nagoram a Brahman of Rahuri who repaired the temple four generations ago. Before that the office of ministrant was held by a family of Guravs. At present the service is divided between the Brahman and the Guravs, the Brahman waiting on the goddess and the Guravs cleaning the temple and performing other minor offices. The Guravs are supported by the every-day offerings, the Deshmukh having a right to all offerings made during the great month of *Chaitra* or March-April. On the two chief April days, the day of no-moon and the day of full-moon, the temple is visited from 5000 to 6000 worshippers. About four-fifths of them come from the Konkan, fishing Kolis, Prabhus, Brahmans, and Sonars. Ekvira is the Kolis' *Kuldevi* or family goddess and they come in parties, each family bringing in a palanquin its goddess, a silver mask of Ekvira. Those who have made vows offer cocks and goats employing a Musalman Mula to cut the victims' throats outside of the temple. The offerers eat the flesh of the victim except that when the victim is a goat, the *patil* or the *deshmukh* has a claim to the head. The chief interest of this small temple is that, as the name Ekvira is apparently the Dravidian Akka Aveyar or the worshipful mother, it would seem to be older than the great Buddhist temple, perhaps its local fame was the cause why this hill slope was chosen as the site of the temple. [The usual derivation of Ekvira is that she was so called because she was the mother of the one hero Parshuram. In connection with the Dravidian origin of the shrine it is noticeable that the names of the latest rebuilders of the temple are Dravidian apparently Bombay Kamathis.] Though all local remembrance of Buddhism is buried under the Brahmanic tales about the Pandav brothers some connection is still kept between Ekvira and the old Buddhist rehc-shrine which the people call the throne of king Dharma the eldest of the Pandav brothers. If their wish is granted, people promise to walk a certain number of times round

Ekvira's shrine. But as Ekvira's image is out in the hill side they cannot walk round it. So on the March-April high days, a large arched wooden frame with a revolving paper lantern in the centre, is set in the body of the rock-temple six or seven yards in front of the relic-shrine. Those who have made a vow to Ekvira make the promised number of circles round the relic-shrine which is in good repair and has the words Dharma Raja painted across the base of the tee that crowns the dome.

Cave Details.

The caves consist of a large chapel or *chaitya* cave and several dwelling caves or *viharas* some of them much ruined. The chapel cave is, without exception, the largest and finest of its class. The cave resembles, to a great extent, an early Christian church in its arrangements, consisting of a nave and side aisles, terminating in an apse or semi dome, round which the aisle is carried. The general dimensions of the interior are 124 feet 3 inches from the entrance to the back wall by 45 feet 6 inches in width. The side aisles, however, are very much narrower than in Christian churches, the central one being 25 feet 7 inches, so that the others are only 10 feet wide including the thickness of the pillars.

"Fifteen [Dr. Fergusson in Cave Temples of India, 236. The 8th pillar on the right is 16-sided, having, in *basso relieve*, on the central north face a small *chaitya*'; on the right a wheel on a support, with two deer at the foot; and on the left, adjacent side, a mall representation of the lion-pillar.] pillars on each side separate the nave from the aisles; each pillar has a tall base, an octagonal shaft, and a richly-ornamented capital on which kneel two elephants, each bearing two figures generally a man and a woman, but sometimes two females,[On the sides next the aisles are horses with single riders on each, but as is usually the case with the horse they are badly proportioned and ill executed.] all very much better executed than such ornaments usually are. [Beginning from the inner end on the east that is next the *daghoba* the first of the right row of pillars has on the east end a ram with feet like a horse and a tail like a tiger; the second pillar on the east a horse with dew caps and an ordinary horse; the third pillar has a horse on the east and a sphinx on the west; the fourth a horse east and a bull west; the fifth a horse east and a horse west; the sixth a horse and a horse west; the seventh a horse east and a bull west; the eighth two horses the ninth a horse east and a bull west; the tenth two horses; the eleventh a bull east and a horse west; the twelfth two horses; the thirteenth two horses; the fourteenth a bull east and a horse west; the fifteenth both elephants. Over the west side of the fourteenth pillar a woman's figure is cut between the horses. The inside figures on the left row of capitals are on the fifteenth or next the door, a bull west and a horse east; on the fourteenth a bull west and a horse east; on the thirteenth a bull west and a horse east; on the twelfth a bull and a horse; on the eleventh a bull or buffalo and a horse; on the tenth a bull and horse; on the the a ball and horse; on the eighth a bull and horse; on the seventh a bull and horse; on the sixth a bull and horse; on the fifth a bull and sphinx; on the fourth a bull and horse; on the third a horse and bull; on the second a horse and bull; and on the first two horses. On the east side of the second pillar are a couple of dancing male and female figures] The seven pillars behind the altar are plain octagonal piers without either base or capital, and the four under the entrance gallery

differ considerably from those at the sides. The sculptures on the capitals supply the place usually occupied by frieze and cornice in Grecian architecture; and in other examples plain painted surfaces occupy the same space. Above this springs the roof, semicircular in general section, but somewhat stilted at the sides, so as to make its height greater than the semi-diameter. It is ornamented, even at this day, by a series of wooden ribs, probably coeval with the excavation, which prove beyond the shadow of a doubt that the roof is not a copy of a masonry arch, but of some sort of timber construction which we cannot now very well understand."

Immediately under the semi-dome of the apse is placed the *daghoba*-in this instance a plain dome on a two-storeyed circular drum-similar to the Bedsa relic-shrine, the upper margins of each section surrounded by the rail ornament, and just under the lower of these are a series of holes or mortices, about six inches deep, for the fastenings of a covering or a woodwork frame, which probably supported ornamental hangings. It is surmounted by a capital of the usual form, very like that at Bedsa, and on this stands a wooden umbrella, much blackened by age and smoke, but almost entire. The canopy is circular, carved on the under surface, and droops on two sides only, the front and rear, the seven central boards being as nearly as possible in one plane, and those towards the front and back canted each a little more than its neighbour.

In the top of the capital, near the north-west corner, is a hole about ten inches deep, covered by a slab about ten inches square and four inches thick, doubtless the receptacle for the relic, which however has been removed. Round the upper edge of the capital are mortice holes, eight in number or three to each face, by which some coronal or other ornament was attached.

"Opposite this," to continue Dr. Fergusson's account, "is the entrance, consisting of three doorways under a gallery, exactly corresponding with our rood-loft, one leading to the centre and one to each of the side aisles; and over the gallery the whole end of the hall is open as in all these *chaitya* halls, forming one great window, through which all the light is admitted. This great window is formed in the shape of a horse-shoe, and exactly resembles those used as ornaments on the facade of this cave, as well as on those of Bhaja, Bedsa, and at Kondane, and which are met with everywhere at this age. Within the arch is a framework or centering of wood standing free. This, so far as we can judge, is, like the ribs of the interior, coeval with the building; at all events, if it has been, renewed, it is an exact copy of the original form, for it is found repeated in stone in all the niches of the facade over the doorways, and generally as an ornament everywhere and with the Buddhist 'rail,' copied from Sanchi, forms the most usual ornament of the style.

"The presence of the woodwork is an additional proof, if any were wanted, that there were no arches of construction in any of these Buddhist buildings. There neither were nor are any in any Indian building anterior to the Muhammadan conquest, and very few, indeed, in any Hindu building afterwards.

"The outer porch is considerably wider than the body of the building, being 52 feet wide by 15 feet deep, and is closed in front by a screen, composed of two stout octagonal

pillars, without either base or capital, supporting what is now a plain mass of rock, but which was once ornamented by a wooden gallery, forming the principal ornament of the facade. Above this a dwarf colonnade or attic of four columns between pilasters admitted light to the great window, and this again was surmounted by a wooden cornice or ornament of some sort, though we cannot now restore it, since only the mortices remain that attached."

The veranda of the great cathedral cave had two eight-sided pillars and two pilasters. Inside of this on each end was a rail and above the rail three elephants. Above the elephants is a second railing into which have been let later seated Buddhas of about the fifth or sixth century, then a plain belt of stone with inscriptions, [See below p. 460.] then a railing, above this two temple doors and two couples men and women dancing, those on the right specially well formed and carved. Above the dancing couples is a plain band, then a rail, then two windows and two doors, again a rail, then two windows and two doors, again a rail, and, above the rail, two windows and two doors, then top rail and roof smooth and well dressed.

In the back wall of the veranda is a central and two side-doors with horseshoe arches over each. On each side of the central doorway are a pair of male and female figures naked to the waist. The couple on the visitor's right are standing, the woman with her left leg turned behind her right leg and her hands broken. The man has his hand on her right shoulder. The woman has heavy anklets and a waistband hanging to her knee. Her right arm is broken above the elbow; her left arm is passed behind the man. The woman has heavy earrings. Her hair is plain and drawn far over her brow and there is a large round brow-mark. The man has his hair piled in ascetic or *jata* coils rising into a central cockscomb. He wears heavy earrings and a waistband hanging to his feet. To the visitor's right of the pair is a Buddha with an aureole and seated on a lotus throne supported by two Nagas. On each side are small figures. On each side of Buddha is a mace-bearer and a flywhisk-bearer and above them two corner figures. To the right is another man and woman much like the other pair.

Below the original rail has been cut into a group of figures, a seated teaching Buddha in the centre, two side supporters and two small cherubs in the corner above. Further east, at the end of the recess, are two figures. The man on the right has a big turban, five bracelets on the right hand, and his legs as if he was walking. The woman has many bracelets on her arm, a necklace with a central pendant like a Lingayat box, double anklets, and crossed legs the right leg in front. To the left of the central door the first figure is a woman who stands with her feet crossed and her arms thrown up clasped palm to palm over her head with long gloves up to her elbow. Her earrings are elaborate and her necklace falls in a stomach. The man on the visitor's left has a bunch in his left hand held over his shoulder. He has three plain bracelets and his left right hand hanging by his side holds his waistband. To the left in a square frame is a central standing Padmapani, his right hand blessing and his left hand holding a lotus. He stands on a lotus throne and on either side are small worshipping figures. On each side of Padmapani are two figures. In the corners above are two small seated Buddhas both teaching. Above are two Buddhas with a mace-bearer below. To the left are a big pair. On the visitor's right is a

man with his left hand held up and open, his hair in the ascetic rolls. His waistcloth is tied in a brow on his left hip. His right hand is on the woman's shoulder. The woman, who is naked to the waist, stands leaning a little to the left with the left knee bent against the right knee. She wears a plain flat headdress which fits her head tightly, large earrings, and a heavy necklace that falls between her breasts. Her left hand rests on her left hip and her right hand falls by her side. Her lower arm is covered to the elbow with heavy plain bracelets.

Below this belt of figures is the Buddhist rail, part of which about four feet broad on the left, has been cut into a group with a seated snake-canopied Buddha in the centre. Above are two small floating figures and side attendants with single snake-canopy. Above the main frieze of figures is a belt of two groups, the Buddha to the left thinking, the Buddha to the right teaching, and with flywhisk bearers at each side. The left or thinking Buddha sits under an arch, the right or preaching Buddha has a great aureole. Above is a plain belt of rock with inscriptions [See below pp. 460-461.] and above that a rail. Then there is the great central horseshoe arch with the side space filled with cave door and window carvings.

At the left end of the veranda at the foot is a Buddhist rail, then three well-carved broken trunked elephants with excellent ears and expressions. Between the centre and the west elephant a group of a seated teaching Buddha with side flywhisk bearers is carved on the back wall. Above the three elephants was originally a three feet broad belt of Buddhist railing cut into three groups of thinking Buddhas with side supporters. The back wall of the veranda has at the foot a central and two side doors and three bands of Buddhist railings, one close to the ground, a second on a level with the top of the doors, and the third on a level with the top of the arch. The lowest rail was the biggest. Below the top rail was a plain belt of rock. The space between the second and the third railing was originally plain. The lowest rail was given by two men and there is an inscription above it to say so. On the left is a defaced inscription. [See below pp. 460-461.]

On each side of each of the doors is a male and female figure. On the visitor's left is a man and woman in the S'atakarni style of dress with many ornaments and a broad waistbelt. Perhaps the inscriptions above the north or right pair and above the pair on the front wall are of about the same time. [See below pp, 460-461.]

The doorways were made about the same time. The images cut in the central railing are of the fifth or sixth century and below the group is a teaching Buddha and above two angels bringing a crown. A man worships a tope. Below are two deer. At the lower right corner the female figure with the high headdress is probably the woman who got the group carved. The mortar work round the central door is Maratha made by a landholder named Anna Goitrikar about 1780.

At the north or left end of the veranda at the foot is a railing, then three elephants with broken tusks, then a rail which has been cut into three groups of Buddhas. The left group is unfinished. The groups belong to the Great Way or Mahayan style and have, instead of flywhisk bearers, Bodhisattvas probably of about A.D. 400-500. Above is the original

inscription of the maker of the cave. Above this is a band of rail pattern, then two temple doors with two well carved groups of men and women. Above this all the work is as it was originally cut, four rows of church fronts each separated from the next by a railing, the three topmost without figures. The groups of dancing men and women in the lower friezes are well carved.

In front of the outer screen stands the Lion-pillar, a plain slightly tapering sixteen-sided shaft, surmounted by a capital of the same style as those in the portico at Bedsa. On this stand four lions, their hinder parts joined, but there is no hole or mortice to lead us to suppose that any emblem in metal or wood was raised over them. The pillar stood on a raised circular basement or drum, carved with the rail-pattern, but now defaced. There are indications that render it more than probable that, as at Kanheri and Kailas at Elura, there was a corresponding pillar at the opposite side, the base of which is covered by the modern Ekvira temple. The cap of the existing pillar is connected with the screen-wall by an attachment of rock, in which is cut a large square mortice; and over the modern temple, on the south side, there remains two-thirds of a corresponding attachment with a similar mortice, as if to hold a beam horizontally across eighteen inches in front of the screen. The other pillar doubtless supported the *chakra* or wheel the emblem of the law.

Inscriptions.

In the veranda and body of the great chapel cave are nineteen; inscriptions.

Inscription 1.

On the left end of the veranda on a deep flat moulding over the heads of three large elephants is inscription 1 which records:

"Seth Bhutapa'la from Vejayanti has established a rock-mansion the most excellent in Jambudvipa."

Inscription 2.

On the lion-pillar or Sinhastambha on the left of the entrance is inscription 2 which records:

"From Agimitranaka, son of Goti, a great warrior, a Maratha (P), the gift of a lion-pillar."

Inscription 3.

On the right end of the veranda below the feet of the elephantti is inscription 3 which records:

"The gift of, first, two elephants, and above and below the elephants a (rail-pattern) moulding by the venerable reverend (bhadanta) Indadeva."

Inscription 4.

Over the right-hand side door is inscription 4 which records;

"The gift of a door by Sihadata, a perfumer, from Dhenuka'kata."

Inscriptions 5 & 6.

A pillar of the open screen in front of the veranda has two. inscriptions 5 and 6. The upper inscription 5 records:

"The gift of Bha'yila the mother of Maha'devanaka, a house holder." (Vejayanti is probably Banavasi in North Kanara. Compare Bombay Gazetteer XV. Part II. 77, 264.) and the lower inscription 6 records:

"Sa'mika, son of Venuvasa, a carpenter, a native of Dhenuka'kata, made the doorway, and above the door."

Inside, on the left hand fourth pillar is inscription 7 which records:

"The gift of a pillar by Sihadhaya, a Yavana, from Dhenuka'kata."

Inscription 8.

On the left or north side of the nave on the shaft of the fifth pillar is inscription 8 which records:

" The gift of the cost of a pillar by Sa'timita, from Sopa'raka, out of respect for his maternal uncle the Bhadanta Dhamutaraya, by his (*i.e.*, the Bhadanta's) disciple and sister's son Satimita, the son of Nanda', with his mother and father."

Inscription 9.

Below inscription 8 in clear-cut letters is inscription 9 which records:

" The gift of a pillar containing relics, by Sa'timita, from Sopa'raka, sister's son of Bhadanta Dhamutaraya."

Inscription 10.

On the same side on the shaft of the third pillar is inscription 10 which records:

"(The gift of) of Dhama, a Yavana from Dhenukakata."

Inscription 11.

On the same side on the shaft of the seventh pillar is inscription 11 which records:

" The gift of a pillar by Mitadevanaka, son of Usabhadata from Dhenuka'kata."

Inscription 12.

On the inner face of the gallery is inscription 12 which records:

" (Gift) of Asa'dhamita', a nun"

Inscription 13.

Outside on the upper frieze to the right of the central door is inscription 13 which records [Compare Bombay Gazetteer, XVI. 569-578.]:

"To the Perfect. Usabhadata, son of Dinika and son-in-law of the king Khahara'ta Khatapa Nahapa'na, the giver of 300,000 cows-having given gold, and being a visitor to the tirth at the Bana'sa' river; the giver of sixteen viliages to gods and Bra'hmans; at the holy place Fabha'sa the giver of eight wives to Bra'hmans; and who caused 300,000 cows to be given; and who at Valuraka gave the village of Karajaka to the Sangha of ascetics from the four quarters residing in the lena, all dwelling there for the support during the rainy season."

Inscription 14.

To the left of the central door and over the sculptures is inscription 14 which records:

"King Va'sithiputa, the illustrious lord (Sa'misiri) [Puluma'yi] in the year seventh (7), of summer the fifth (5) fortnight, and first (1) day. On that day Somadeva, a great warrior, the son of Vasithi and of Mitadeva the son of Kosiki, a great warrior of the Okhala-kayas, gave a village to the Sangha of Valuraka. This gift is for the repairs of the Valuraka Lenas."

Inscription 15.

Over the male and female figures to the right of the right of the right-hand side door is inscription 15 which records:

"Gift of a pair by the Bhikshu Bhadasama"

Veluraka appears to be the ancient name of the monastic establishment at Karle.

Inscription 16.

Over another pair of figures on the inner side of the right end of the outer screen or front of the veranda is inscription 16 which records:

" Gift of a pair by the Bhikshu Bhadasama " [Valuraka appears to be the ancient name of the monastic establishment at Karle.]

To the left of the central door on a piece of rail-pattern carving below the sculptures is inscription 17 which records:

"..... the gift of a vedika by the mother of Samana"

Inscription 18.

Low down and to the right of the central door is inscription 18 which records:

"The gift of a vedika' (rail-ornament) by the nun Kodi mother of Ghunika. Made by Nadika."

Inscription 19.

Just over an image of Buddha inserted at a later date between the central and right-hand door is inscription 19. It is dated the 19th year of Vasisthiputra's time, and records a benefaction to the Bhikshus by the talukdar of Mamala, the modern Maval. [Archological Survey of Western India No. 10, pp. 28-36.]

On the north-west of the Lion-pillar are some cells, and a water-cistern, into which a *daghoba* that had stood on the roof of it has fallen. North from this is a large excavation, more than 100 feet in length, but very irregular: it apparently consisted of two or three *viharas*, in which all the dividing walls have been destroyed. At the north end of it are several cells, still nearly entire, three water-cisterns, and a small relic shrine or *daghoba*.

Above these is a *vihara*, about 28 feet by 27 and 8 feet high, with four cells in each side and five in the back, six of them with benches or beds of stone as in most of the older *viharas*, and in one is a ladder up to a stair leading to the cave above. The front of this cave, however, has given way. Still higher in the rock, and reached by a stair from the preceding, is another *vihara*, 34 feet 6 inches by 48, but not quite rectangular, and 8 feet 11 inches high. It has three cells in the right end and five in the left, with six in the back. Across the left end is a raised platform about 8½ feet broad and 18 inches high, along the front of which there seems to have been a wooden railing or screen. On the east and south walls are two sculptures of Buddha, evidently of much later workmanship than the cave. The front wall is pierced with four openings, and the veranda 40 feet 10 inches long, 7 feet wide, and 12 feet 3 inches high, has a low screen-wall in front, on which stand four columns between pilasters. Outside this screen, at the north end, is a water-cistern, and along the front a balcony.

Further north (the lower part of the stair broken away), is another *vihara* above those first mentioned. It is about 38½ feet long and 17 feet deep, with two cells in each end and four in the back, five of them with stone-beds. In the front wall are a door and two windows,

but the corridor of the veranda has given way. On the east wall of this cave is inscription 20 which records:

Inscription 20

"To the perfect! The king V'asithiputa the illustrious (siri) Pulima'vi, in the year (of his reign) twenty-four (24), in the third (3) fortnight of the winter (hemanta) months, the second (2) day. This meritorious gift of a nine-celled mandapa by the (Upa'saka) layman Harapharana, son of Setapharana, a Sovasaka, native of Abula'ma, [Probably Obollah at the head of the persian Gulf. Compare Bombay Gazetteer, VII 421 note. 2] for the possession of the Sangha of the Maha'sanghas from the four quarters. For the continuance in welfare and happiness of father and mother and all people and living things. Established in the twenty-first year, and with me Budharakhita and his mother an Upa'sika'. And in addition the meritorious gift of another passage by the mother of Budharakhita".

Inscription 21.

In a recess over a water-cistern at the end of the next cave is inscription 21 which cannot be translated. The sense runs:

"In the fifth year and of the Hemanta-paksha (of some king possibly puluma'yi), the female disciple of (some) Bhadanta, gave a lina; and a sister's daughter a Sra'vika' (or laic)-gave a cistern for the sangha of ascetics. [With the donor several other names of relations are associated (but obliterated) with Usabha, a female disciple."]

To the south of the *chatiya* cave there are also a number of excavations, the first being an unfinished hall about 30½ feet wide by 15½ feet deep. The next is a small room 6 feet by 7½ and 6 feet high, of which the front is broken away, with a figure of Buddha on the back wall. Close to this is a water-cistern, and beyond it a *vihara*, 33 feet 3 inches wide by 32 feet 10 inches deep and 9 feet 5 inches high with four cells (without beds) in the back, three in the left end and two unfinished ones in the right, all having their floors about a foot higher than that of the hall. In the middle of the back wall is a figure of Buddha, seated with his feet resting on a lotus, under which is the wheel between two deer, and behind this are two small worshipping figures. On each side are fly whisk bearers the one on his right holding a lotus stalk in his left hand, and over their heads are *vidyadharas* or heavenly choristers. This hall bears evident marks on the floor, ceiling, and side walls, of having been originally only 21 feet 6 inches deep, but afterwards enlarged.

The front wall is pierced by a door and two windows, and the veranda, 25 feet long by 6 feet 4 inches wide, has a cell at the north end and two octagonal pillars between pilasters in front, each pillar being connected with its adjacent pilaster by a low parapet or screen which forms the back of a bench on the inside, and is divided outside into four plain sunk panels, similar to several at Pal near Mahad in Kolaba, cave VI. at Ajanta and others. To the entrance the approach has been by a flight of steps. Beyond this is a small unfinished

room, and at the turn of the hill, facing south, is another, 8 feet 5 inches by 9 feet and 7 feet high, with a bench along part of the east wall. The front has gone, but on the wall under the caves is a fragment of an inscription (22) which records:

Inscription 22.

" To the Perfect. The meritorious gift of the ascetic Budharakhita."

A little to the east, and about 5 feet above the footpath, is another cave, 14 feet 5 inches by 13 feet 4 inches and 6½ feet high, with a cell in the left wall having a bench or bed. Beyond this is a small water-cistern.

Hill Top.

From the right side of the great cave a rough path clammers about two hundred feet up a bare rocky face to the flat top of the spur. This, which, except a very old and gnarled *umbar* tree at the end, is bare and baked, has the remains of three buildings and towards the west a slight hollow with the earth-filled mouth of an old water cistern. The building most to the end of the spur seems to have been square about 17' x 14' and of brick. It was probably either a rest-house or a temple. About thirty yards to the north, along the bare top of the spur, the ground rises about 550 feet above the Karle bungalow into a mound of rough undressed stones brick and earth 39' north and south about all earth and stone except on the west or weather side. The stones are not dressed but flat and like big bricks. The earth or clay is very stiff. The height is about nine feet above the ground that slopes to the west. A few yards further north is the site of another brick building probably a *stupa* most of which has been removed. The top of the mound is 550 feet above the Karle bungalow. About fifty yards further north is a flat rock which was perhaps roughly carved into a seat.

In the hills near Karle are a number of cells and rock cisterns. Thus in the hill above Devgad a little to the south-west of Karle is a half finished *vihara* or dwelling cave with two roughly hewn square pillars in front with bracket capitals and in the back of the cave a door has been begun as if for a shrine. In the rising ground to the east of the village is a rock-cut pond and some cuttings as if intended as the beginning of a small cave and cistern.

Again, on the south side of the village of Sheletana is a large covered rock cistern, originally with six openings, and high up the hill to the north is a large cavern under a waterfall. In the north side is a round hole which has been fitted with a cover, and was perhaps intended for storing grain. Beside this is a small circular chamber which may have contained a structural relic-shrine or *daghoba*. The roof of the cave has fallen in, and there has been a great flaw in the rock, which perhaps led to the cave never being finished. At Tankve still further east are two rock cisterns, and above Valak in the face of the scarp is a small round cell as if for a relic-shrine and near it a cave without front, a slightly arched roof and a cell at the back, with a round hole near the entrance, possibly a place for holding stores. A flaw in the rock has destroyed the back of this excavation. At

Ayara to the east of Bhaja and in several places to the north-east of Karle there are also excavations mostly single cells for hermits. [Cave Temples of India, 242."]

VIR.

Vir, about eight miles south west of Jejuri in Purandhar, is a large village with in 1881 a population of 2715. At Vir are the headwords of the Nira canal [Details of the Nira canal are given under Agriculture, Part II. pp. 20 - 24.] and it has a temple of Mhaskoba, a modern Kunbi god, which enjoys about four acres of rent-free land assessed at £3 10s. (Rs. 35). A yearly fair, lasting for nearly a fortnight and attended by 8000 to 10,000 persons, is held at the temple on the full-moon of *Magh* or February-March. The temple devotees, who are called Virs or heroes, perform a sword dance before the god and in their enthusiasm often wound themselves and each other. About 1834 an excited Dhangar put the hilt of his sword on the ground and its point to his navel, and, falling on it, gashed his bowels so that he died. [Oriental Christian Spectator, VIII. (1837), 133.]

YEVAT.

Yevat, on the Peninsula railway twenty-six miles east of Poona, with in 1881 a population of 1539, has a station with to its south a travellers' bungalow. The 1880 railway returns showed 12,014 passengers and no goods. The Khadakvasla canal flows close to Yevat and there is also a large storage pond called Matoba which irrigates a considerable extent of land and is fed by the canal in the neighbourhood. [Mr. J. G. Moore, C. S.]

APPENDIX

GUNPOWDER FACTORY.

THE following details on the ingredients manufacture and examination and proof of Gunpowder have been contributed by Lieutenant-Colonel Wake, R. A.:

Saltpetre Refining.

The refining of saltpetre is based upon the fact that saltpetre is far more soluble in hot than in cold water, while the chief saline impurities found in rough saltpetre are almost equally soluble in either. Water at 212° holds about seven times as much nitrate of potash or pure saltpetre in solution as water at 70°. If, therefore, a saturated solution of saltpetre be made at a temperature of 212°, and the chlorides of sodium and potassium are contained in the liquor, as the solution cools to 70°, six-sevenths of the nitre contained in it will be deposited in the form of crystals, which can easily be removed, whereas the foreign salts will still remain in solution.

Solution.

Two large refining coppers, each capable of holding about 500 gallons are charged with saltpetre and water in proportions so that when boiled the whole of the saltpetre may be dissolved. The boiling is performed by steam forced into the coppers through a perforated pipe running round the interior of the coppers near the bottom. In the process of boiling a good deal of scum is found on the surface of the liquid which is skimmed off from time to time. To assist it in forming, a little glue is thrown in when the water begins to boil. By the time the scum has been cleared off, the solution will be ready for filtering, when a valve near the bottom of each copper is opened which allows the liquid to run out. Through this valve it passes to a range of canvas filter bags or *daulas* which catch all insoluble impurities. Up to this point the liquid is kept as hot as possible, to carry as much of the pure saltpetre in solution through the filters as practicable. Care is also taken that the solution is not too thick or it will not run easily through the filters. To ensure this the specific gravity of the solution should be about 1.49. The solution now free from all its insoluble impurities runs from the filters into large flat copper coolers called crystallizing pans.

Crystallizing.

The crystallizing cisterns, or coolers, are each twelve feet square and about eleven inches deep, and the solution from five to six inches deep. The liquid is kept in agitation with a long handled wooden hoe, and as it cools fine crystals fall to the bottom of the cistern. If not kept in agitation, large crystals would form, which would enclose the liquid containing the impurities still in solution. The crystals are from time to time drawn up to one side of the cistern, the bottom of which is raised so as to form an inclined plane to receive it. From this the liquor drains off, and the crystals looking almost like snow, and technically called flour, are then raked into the washing cisterns. The solution in the crystallizing cistern is not stirred, nor are the crystals removed, after the temperature falls below 100°, as the crystals are then deposited so slowly, but it is left to cool, when large crystals form which are treated as rough nitre.

Washing.

The washing cisterns are about six feet long, four feet wide, and three feet six inches deep, and are fitted with a false bottom of wood pierced with holes. In front below the false bottom is a plug hole. The cistern being now nearly full of saltpetre, distilled water is poured from a rose above each cistern enough to cover the saltpetre, and is allowed to stand in the cistern from half an hour to one hour, after which it is run off from a tap at the bottom. This is repeated by another washing, but now the water is not run off till next morning. If not enough, a third washing is sometimes given. The saltpetre is now ready and placed in the store bins. A solution of the saltpetre should now be tested as follows:

Testing the Saltpetre.

(a) With blue and red litmus paper for acids or alkalies; (b) with a few drops of the solution of nitrate of silver for the presence of chlorides, a milky appearance indicating the formation of the insoluble chloride of silver, this is a very delicate test; and (c) with a

solution of chloride of barium for the presence of sulphates, which would give the insoluble sulphate of baryta. The refining operation over, there remains saltpetre in the crystallizing coolers, which has formed into large crystals since the stirring of the liquid ceased, and which contains impurities. This is used as grough in the next day's refining. There is also a large quantity of liquid, more or less impure, containing saltpetre, both in the crystallizing coolers and in the tank into which the water used from the washing vats has been drained.

In other Gunpowder factories the collection of the saltpetre in this liquor forms an important and expensive part in the process of refining, and is effected by boiling down the liquid (amounting to from 600 to 800 gallons) to about a quarter of its original bulk, when the remainder is run through filters into pans and collected. When it has crystallized the saltpetre so collected is used as grough during the next day's refining.

The boiling down of such a large quantity of liquid consumes a great deal of fuel, and adds much to the expense of refining. To avoid this advantage has been taken here of the dry climate of the Deccan, and the whole process of evaporation is carried on without expense by pouring the water into a large empty masonry reservoir (which it covers to the depth of about an inch), and letting it evaporate of itself. This it does in from twenty-four to forty-eight hours according to the time of the year; the saltpetre contained in it forming in crystals during the process and being afterwards collected and used as grough on the next day's refining. This plan is not practicable in the rains, but enough saltpetre can be refined during the dry months to last through the monsoon till evaporation can again be carried on.

The extraction of saltpetre from powder sweepings and from damaged powder is a process which has to be carried out in all Gunpowder factories. As usually effected it is a very dirty troublesome and expensive operation. The saltpetre contained in condemned gunpowder, and also in the sweepings from the factory, is extracted by boiling with water in coppers holding about 400 gallons each, and filtering the solution first through coarse canvas and a second time through *daulas*. The liquor containing the saltpetre is then evaporated down, filtered, and crystallized in pans as before. The charcoal and sulphur left in both sets of filters is again boiled before being thrown away. About 91 per cent of the saltpetre contained in powder can be recovered by extraction, against the value of which must be set the cost of labour and fuel. At this factory however the operation is very simple and inexpensive. The process consists of putting the powder sweepings or damaged powder into large porous earthenware vessels which are then filled up with cold water. This water filters through the vessels into copper troughs in a few hours, taking with it as much saltpetre as cold water can hold in solution. A fresh quantity of water is poured into the vessels every morning for about a week, by which time nearly all the saltpetre has been extracted. About two per cent. of the saltpetre remains unextracted with the sulphur and charcoal in the vessels. All the water is then poured into the reservoir to evaporate and within twenty-four hours the crystals of saltpetre can be collected and are afterwards used as grough saltpetre.

[Charcoal Burning.](#)

As a general rule the wood should be cut when the sap is up, as it can be then most easily stripped of its bark, but in the case of *Cajanus indicus* or *tur* wood it is cut when the crop is ripe and has to be soaked in water before the bark comes off easily. The wood yields about one-fourth its weight of charcoal. Being cut into lengths of three feet, the wood is packed into iron cylindrical cases called slips, which are three feet six inches long and two feet four inches in diameter, care being taken that the wood is as much the same size as possible. The lid is fastened on, two openings being left in the slip at the bottom of about four inches in diameter. The slips are then placed in horizontal cylinders or retorts, the end with openings (one below and the other above) first. The retorts, which have openings at the far end to correspond with those in the slips, are closed by tight-fitting iron doors. The retorts are built into the wall, with furnaces so arranged underneath as to admit of the accurate regulation of heat throughout the operation of charring. This occupies about four hours for R. F. G., eight hours for R. F. G. 2, and two or three hours for cannon powders. The flames surround the retorts, the heat acting as nearly as possible on the whole surface of the cylinder. The gases from the wood pass out from the upper hole in the slip, and the tar through the lower hole (both holes corresponding with holes in the retort) into pipes communicating with the furnace in which they are burnt. This saves a considerable amount of fuel. When the wood has been sufficiently charred, which is known by the violet colour of the flame from the burning gas, indicating the formation of carbonic oxide, the slip is withdrawn by tackling placed in a large iron case or cooler, covered with a close-fitting lid, and allowed to remain until all the fire is extinguished, which takes about four hours; and the charcoal is then emptied into smaller coolers and sent to store. The charcoal is carefully looked over and picked by hand, to see that it is all properly and evenly burnt, and that no rivets from the slips have broken off. It is then kept from ten days to a fortnight in store, before being ground, to obviate the danger of spontaneous combustion, to which charcoal is liable when ground directly after burning. This arises from the heat generated by the very rapid absorption and condensation of oxygen from the air by the finely powdered substance. The charcoal for cannon powders is burnt a short time at a high temperature and is called Black coal. That for small arms is burnt for a longer time at a low temperature and is called red coal. "Black coal" should be jet black in colour, its fracture should show a clear velvet-like surface, it should be light and sonorous when dropped on a hard surface, and so soft as not to scratch polished copper. Slack-burnt charcoal, that is charcoal prepared at a very low temperature, is at once known by its reddish brown colour, especially when ground; this colour is distinctly perceptible in the R. F. G 2 powder up to the glazing process. Charcoal burnt at a very high temperature is known by its hardness metallic ring and greater density.

Sulphur Refining.

The Sulphur used in the process of refining is of the best quality. It undergoes a rough purification before importation, leaving about three to four per cent of earthy impurities which have to be got rid of by a second distillation. The refining apparatus is very simple. A large iron melting pot or retort is set in brickwork, about three feet above the floor, with a furnace underneath; this retort has a heavy movable lid, which is luted into the pot with clay, and in the lid is a four-inch opening, closed by an iron conical plug that can be removed at pleasure. From the melting pot, lead two pipes, at right angles to one another,

one fifteen-inch to a large circular dome, and the other five-inch to an iron receiving pot, placed below the level of the melting pot. The latter pipe has an iron casing or jacket round it, through which cold water is allowed to circulate. The communication of these pipes with the melting pot can be shut off or opened as required by valves worked from without.

The process of refining consists of melting the rough sulphur in the melting pot and allowing it to distil over into the receiving pot, and is carried out at other factories in the following way:

About 5½ cwts. of rough sulphur is placed in the pot each morning. The fire being lighted, the conical cast-iron plug is left out of the hole in the lid of the pot, the passage into the dome is opened, and that into the receiving pot closed. The heat is maintained for three hours, till the sulphur is of a proper temperature for distillation. The vapour which first rises from the pot is of a pale yellow colour, and as much of it as passes into the dome falls down condensed as flowers of sulphur. But at the end of three hours the vapour becomes of a deep reddish brown colour, showing that the temperature of the melted sulphur has reached the proper point. The plug must then be inserted in the lid, the communication to the dome closed, and that leading to the receiving pot opened, allowing the heavy vapour to pass through the pipe surrounded with the water jacket, by means of which a constant circulation of cold water is kept up round it. In this way the sulphur vapour is condensed, and runs down into the receiving pot as a clear orange liquid resembling treacle in colour and consistency. When nearly all has passed over into the receiving pot, which can be known by the jacket getting cold, the pipe communicating with the receiving pot is again closed, and the fluid sulphur left about an hour to get sufficiently cool (not below 220°) to ladle out into the moulds (wooden tubes saturated with water to keep the sulphur out of the cracks); at the same time the furnace doors are thrown back, and the communication with the dome re-opened, so that the rest of the vapour may pass into it; the impurities all remain at the bottom of the melting pot, and are thrown away. The flowers of sulphur thus obtained, being unfit for the manufacture of gunpowder, are treated as rough sulphur. The crystalline sulphur, after being allowed to cool in the moulds, is broken up and put into barrels ready to be ground.

Refined sulphur may be tested as follows: (a) by burning a small quantity on porcelain, when the amount of residue should not exceed 25 per cent; (b) by boiling a little with water, and testing with blue litmus paper, which it should only very feebly redden. In this factory the above plan is deviated from considerably. The amount of sulphur charge put into the melting pot elsewhere is limited to 5½ cwts. because the sulphur in the course of melting reaches a temperature at which it catches fire, and, if the quantity of the charge exceeds about 5½ cwts. the flames get very violent and rush out of the top of the pot in a series of puffs like the steam escaping from a locomotive. The violence of these puffs will at times amount to an explosion of sufficient strength to blow off the lid of the pot and might do considerable damage. This flaming gradually dies out before the charge is ready for distilling. It was found here that the flaming stage could not take place when the melting pot was full of sulphur vapour, the air necessary to support combustion being thereby excluded. On this idea operations are now begun on the first day always on the

usual plan, but as soon as the process has once passed the flaming stage and the pot is full of sulphur fumes to add as much sulphur to the charge as the pot will hold. By leaving a little sulphur in the pot at the end of each day's work and keeping it warm all night the pot is full of fumes next day and can be filled up at once. The advantage of this plan is that, whereas in other factories only 5½ cwts. can be refined at one operation, 14 cwts. can be refined here, and the expenditure of fuel for the large quantity is the same as that required for the smaller quantity.

Processes of Gunpowder Manufacture.

The manufacture of gunpowder from the prepared ingredients involves nine processes with slight variations in the case of some of the very different natures of powder now being made. The first process is mixing the ingredients, which is a preparatory operation to the second process of incorporation or grinding together of the mixed ingredients whereby the explosiveness of the powder is given. The third operation is breaking down the mill-cake which is an intermediate operation to prepare the powder for pressing which is the fourth process and consists of the pressing of the powder into its desired state of uniform consistency or density as well as to make it of a convenient hardness to cut into grain. The fifth process is granulating or corning that is the breaking up of the powder into the requisite size of grain. The sixth process is dusting that is getting rid of the dust amongst the grain, as the presence of dust would interfere with the next operation of glazing that is giving a smooth surface and polish to the grain. The eighth process is stoving or drying that is getting rid of the superfluous moisture in the powder, whereby, as also by glazing, the keeping qualities of the powder are given. The ninth or last process is finishing or separating, that is a final sifting of the powder.

Weighing (1).

(1) The ingredients are brought into the mixing house and are very accurately weighed out in separate scales, in mill charges (in their proper proportions to 100 lbs.) with an extra amount of saltpetre according to the moisture contained in it. The largest charge authorized for the incorporating mills for small arm powders is 50 lbs.; for cannon powders, the materials of which are not so violent in their action, and the charges worked with a greater percentage of moisture, the weight is 60 lbs.

Mixing.

After weighing the charge is placed in the mixing machine which consists of a cylindrical gun-metal or copper drum, about 2' 9" in diameter and 1' 6" wide, with an axle passing through its centre, on which there are eight rows of gun-metal flyers like forks. The machinery is so arranged that the flyers and drum revolve in opposite directions, the drum making in a minute about forty revolutions and the flyers eighty. The ingredients are mixed for about five minutes; the machine then empties itself into a box, and the composition is passed through an eight-mesh copper-wire hand sieve over a hopper, in order to catch any splinter of wood, small copper nail, or other foreign substance which may have got into the saltpetre during the process of refining; it runs into a bag placed

below the hopper, and is tied up ready for the incorporating mills. In this state it is called a " green" charge.

Incorporation (2).

(2) The incorporating mill consists of a circular iron bed about seven feet in diameter whereon two iron rollers revolve. These are about six feet in diameter with edges fifteen inches wide weighing each about four tons.

They make eight or nine revolutions round the bed each minute. The bed has a rim on the outside, called the curb, and on the inside an edge formed by the cheese or socket through which the vertical shaft passes. The runners are not equidistant from the centre of the shaft; one works the part of the charge nearest the centre of the bed, the other the outer part, but their paths overlap; two ploughs of wood, covered with leather, attached to the cross-head by arms or brackets, one working next the vertical shaft, the other next to the curb, throw the composition under the runners, as it works away from them.

The green charge is brought in its bag and spread evenly on the bed of the mill by means of a wooden rake, the mill bed having been previously moistened with water. Each charge is worked about 3½ hours for R. F. G. powder and six hours for R. F. G. 2; cannon powders require less milling.

Amount of Liquor.

The charge when placed on the bed of the mill contains about two pints of water (the moisture of the saltpetre) and a further quantity of from two to fifteen pints including that first passed in the mill bed (of distilled water) is added from time to time, according to the state of the atmosphere, to facilitate the incorporation and reduce the effect of an explosion. If too wet, the runners would lick up the composition from the bed. During the time of working the charge, the millman enters the mill occasionally, takes a wooden shover and pushes the outside of the charge into the middle of the path of the runners so that every portion may be regularly incorporated. The action of the runners is a combination of rolling and twisting, and has on a large scale somewhat the effect of a pestle and mortar, crushing rubbing and mixing, thus giving the charge a most intimate union.

Drenching Apparatus.

Each mill has a flat wooden lever board or shutter, directly over its bed, in gear with a cistern of water, and so arranged that when the shutter is in the least degree raised on its pivot by an explosion, the cistern is upset into the bed, and the charge drowned. A horizontal shaft connects all the shutters in a group of mills, so that the explosion of one mill drowns all the remainder. The cistern can also be pulled over by hand.

Mill-cake.

When the charge, which in this state is called mill-cake, is ready to be taken off the mill, it should be uniform in colour, not having any specks of either saltpetre or sulphur visible to the eye, and of a grayish or brownish colour, according to the charcoal used. When a small piece is broken in the hand and thrown on to the rim or curb of the mill a portion of dust should rise. The incorporation should be carefully attended to by experienced men as the strength and general characteristics of the powder depend more upon this process than on any of the others. The mill-cake is carefully tested every day to ascertain whether it contains the proper amount of moisture; this should be 1½ to 3 per cent for small arm powders, and 3 to 4 per cent for the larger descriptions of gunpowder.

Breaking down the Mill-cake (3).

(3) The mill-cake on being taken off the bed of the mill is placed in wooden tubs and moved to small magazines, from whence it is taken to the breaking-down house. The object of this process is to reduce the cake, which is now partly in lumps and partly in powder, to a uniform meal, in order that it may be in a convenient form for loading the press-box. Breaking down is done by hand, the press cake being beaten by wooden mallets on a tray till it is reduced to meal, when it is ready for the press.

Pressing (4).

(4) The press-box is a very strong oak box, with gunmetal frame, 2' 6" square and 2' 9" deep, so constructed that three of the sides can turn back on hinges, or form a compact solid box when screwed firmly together. Being laid on its side, the real top temporarily closed by means of a board, and the uppermost side alone open, a number of copper or gunmetal plates, 2' 5½" square, are placed vertically into this box, and kept apart at a distance (depending on the description of powder required) by two gunmetal racks, with corresponding grooves, which can be removed when no longer required. In pressing the thicker slabs for pebble powder which have to be afterwards cut into cakes, the press-box is divided vertically by a partition into two parts, a corresponding division being made in the fixed press block.

About 600 lbs. of meal is put into the press-box, while the plates are in a vertical position, and rammed evenly down by means of wooden laths. When full, the racks are withdrawn, the plates being only separated by the meal between them; the present upper side is firmly screwed down with short gunmetal screws, and the box turned over, so that the plates are now horizontal; the temporary lid is taken off, and the block run forward into position above the box. The pumps, which work the hydraulic press in a separate house, are now set in motion and the box is raised until the necessary amount of compression has been given, according to the density required. For this purpose the block is allowed to enter the box a certain distance, which is measured by a scale marked on the block. This mode of regulating the pressure gives more reliable results than trusting to the indicator gauge of the hydraulic ram, for the reason that the elasticity or resistance to pressure of the meal varies considerably with the amount of moisture present in it and the state of the atmosphere. To get uniform density equal quantities of meal, containing equal amounts of moisture, have to be compressed at the same rate into the same space. In practice,

however, the moisture in the meal will vary slightly, whatever care be taken, and even if the mill-cake were always taken off the bed perfectly uniform in this respect, the hygrometric state of the atmosphere would cause a difference by the time it came to the press. Moreover, it is found that atmospheric conditions have an influence upon the manner in which powder meal can be compressed, even apart from the actual percentage of moisture contained in it, so that the exact distance the press block is allowed to enter the box has to be varied with the season, and even the prevailing state of the weather.

After the required pressure has been given a valve is opened to let out the water from the cylinder of the press, and the press-box descends till it is free of the block. The latter is then pushed back and the box is turned over on its side to be unloaded. The three movable sides being unscrewed and laid back the press cake is taken out, in layers of nearly $\frac{1}{2}$ an inch thick for the smaller powders, after which it is broken down into coarse grain between metal rollers. For pebble powder the layers or slabs are $\frac{5}{8}$ of an inch thick and are kept intact for the next operation.

Granulating or Corning (5)

(5) The granulating or corning machine consists of two parts. One is a series of three pairs of metal rollers so arranged one beneath the other as to gradually break down the coarse grain received from the press house to the required size for the description of powder being made. The top pair of rollers are placed under a hopper so that all the powder poured into the hopper passes between them. From this pair (which are not set very close together) the powder is conveyed down an inclined plane to the second pair, which are set rather closer together, and so on to the third pair, which are set so close as to give the exact amount of crushing required. The second part of the machine consists of a set of sieves on a square frame, which is violently shaken laterally. The grain which has passed the third pair of rollers is thrown on this frame and falls on the top sieve. Any grain which is too large does not pass this sieve and is shaken into a receptacle placed to receive it, while all the rest falls through the sieve and is caught on one below, which is of rather finer mesh retaining all the grain of the proper size. This is shaken into another receptacle placed for it, while the grain that is too fine passes the lower sieve to a third receptacle. The proper size grain, then called foul grain, passes on to the next operation, while all that is too big or too small is called dust and sent back to the incorporating mills, where it is milled about forty minutes previous to being mixed with green charges and sent to the press again. In this and in all subsequent operations a quantity of dust accumulates which is all sent back to the incorporating mills to be treated in the same manner.

Cube-cutting Machine.

Pebble powder is granulated, or cut, in a special machine, which cuts the press-cake first into strips, and then again, crossways, into cubes of $\frac{5}{8}$ length of edge. This is done by two sets of phosphor bronze rollers, which have straight cutting edges arranged along their surfaces, and which are set at right angles to each other; an ingenious arrangement

causing the long strips cut by the first pair to travel endways to the second pair to be cut into cubes.

Dusting (6).

(6) Dusting is performed in horizontal or slope reels. These are large cylindrical sieves about eight feet long by two feet in diameter, which revolve with about forty revolutions a minute, inside wooden cupboards. In the case of horizontal reels, the foul grain from the granulating machine is put inside them, and run for some time to get rid of the dust. This falls through the sieve to the bottom of the cupboard, whence it goes back to the incorporating mills as "dust." When the powder that remains in the sieve is fairly free from dust, one end of the reel is lowered and opened to allow the powder to be run out into tubs. A slope reel has one end permanently lower than the other, and open; the powder is poured in at the upper end from a hopper, and, as the reel revolves, gradually travels to the lower end, whence it falls out into tubs placed for its reception. Horizontal reels are generally used for the double purpose of getting rid of dust, and rubbing the edges off the grain, as also sometimes for polishing; while slope reels are only used for getting rid of dust. The horizontal reels are very little used in this factory. For pebble powder, a peculiar slope reel with a copper wire mesh of suitable size is placed in connection with the cube-cutting machine, so that all the cubes pass through it before running into the tubs placed for their reception.

Glazing (7).

(7) Glazing is performed in large wooden barrels which revolve on a horizontal axis. In these barrels about 400 lbs. of powder are placed, and the barrels are made to revolve for several hours at rates varying according to circumstances from 14 to 35 revolutions a minute.

Stoving or Drying (8).

(8) Powders that require stoving are placed in a drying stove, which is merely a room heated by steam pipes, fitted with a number of shelves, on which are placed shallow trays with canvas bottoms, filled with a layer of powder. The powder is thus placed to expose it as much as possible to the heat of the room. Powders of different descriptions require different degrees of heat, and that the operation be more or less prolonged according to the size of grain.

Separating (9).

(9) To finish the powder there is yet another final operation for all powders smaller than pebble powder, namely, separating. This is merely passing the powder through a large sieve shaken by machinery (somewhat on the same principle as those in the granulating house) to get rid of any dust or broken grain which may have accumulated during the glazing and drying.

Concluding Remarks on Manufacture.

So far the general principles on which the different processes of powder-making are worked have been described, and only here and there has any mention been made of the variations in manufacture necessary to produce different descriptions of gunpowder. It remains therefore to explain how the processes-can be varied to produce the differences necessary to make suitable powders for special purposes. As regards the ingredients themselves, their proportions are not allowed to be altered; and with this prohibition it is impossible to effect any differences in the finished gunpowder as far as saltpetre and sulphur are concerned. With the charcoal it is not so, for by using different sorts of wood, as also by varying the intensity of the heat at which the wood is burned, very great effect is produced on the strength of the powder. In consequence of this the quality of the charcoal is of great importance.

After the ingredients are mixed, the first place where the powder can be varied is the incorporating mill, where the degree of explosiveness of the powder can be regulated by the amount of milling given to the charge, as also by the amount of moisture. Next the quickness of burning can be varied by the amount of density given by the hydraulic press. The next process, the cutting into grain, depends chiefly on the state of the powder on leaving the press. If it is right in density and moisture, it will cut into good firm grain; while if it is too hard or soft, too dry or wet, it will crumble, or clog, or cut into flaky grain. In the after processes of dusting and glazing some alteration can be made in the powder, chiefly by varying the length of glazing and the pace at which the glazing barrels revolve. The chief characteristics of the powder however have been given to it by the time it has left the press.

After a convenient quantity of gunpowder has been made, generally amounting to between ten and fifteen thousand lbs., it is proved as described below. If it passes the proof it is put into barrels of a capacity of fifty or a hundred pounds, and delivered to the Ordnance Authorities for use in the Government service. If it does not pass, it is modified by mixing, or re-worked as the case may require.

Examination and proof of Gunpowder.

The tests to which powder is subjected are intended to ascertain nine points. The first point is that the powder should have a proper colour, a proper amount of glaze, a sufficiently hard and crisp texture, and freedom from dust. These points can be judged by the hand and eye alone, and require a certain amount of experience in the examiner. The cleanness of the powder can be easily tested, by pouring a quantity from a bowl held two or three feet above the barrel in a good light. If there be any loose dust it will be readily detected.

The second point to test is whether it is properly incorporated. This is tested by flashing; that is, burning a small quantity on a glass, porcelain, or copper plate. The powder is put in a small copper-cylinder, like a large thimble, which is then inverted on the flashing plate. This provides for the particles of powder being arranged in pretty nearly the same

way each time, which is very important. If the powder has been thoroughly incorporated, it will flash or puff off when touched with a hot iron, with but few lights or sparks, and leaving only some smoke marks on the plate. A badly incorporated powder will give rise to a quantity of sparks, and also leave specks of undecomposed saltpetre and sulphur forming a dirty residue. Although a very badly worked powder could be at once detected, yet, as a comparative test, flashing needs an experienced eye to form an accurate judgment. Powder once injured by damp will flash very badly, no matter how carefully it may have been incorporated. This arises from a partial solution of the saltpetre.

The third point to test is the size, shape, and proportion of the grains. The shape can be judged by the eye alone, and the size of grain, in large uniform powders cut by machinery, is usually tested in the same way or by actual measurement; but a granulated powder can usually be readily sifted on the two sieves which define its highest and lowest limit of size; it must all pass the one and be retained on the other. For example, the Martini-Henry (R. F. G.²) powder must pass through a sieve of twelve meshes to the inch, and be retained on one of twenty meshes. This sifting, however, conveys no idea of the proportions of different sized grains contained in the powder. For instance, a sample of R. F. G.² powder consists entirely of grains just small enough to pass the twelve-mesh sieve, or just large enough to be retained on the twenty mesh; and these two powders would give very different results. To obviate this, one pound is sifted on three sieves, a twelve-mesh, a sixteen-mesh, and a twenty-mesh, and the limits allowed are as follow:

Pass 12-mesh to 16 mesh	12 ozs.
„ 16 „ 20 „	3 „
„ 20 „ -- „	1 „
	16 ozs.

Density.

The fourth point to test is density. This is ascertained to three places of decimals by the mercurial densimeter. It must, for each description of powder, lie between certain limits as shown in the table below. Bianchi's densimeter consists of an apparatus by which the air can be exhausted from a removable glass globe, fitted with stop cocks, and mercury allowed to 611 it. The process of taking the density of gunpowder is as follows. The air being exhausted, the globe is filled with mercury, removed from the machine, and accurately weighed. The globe is then emptied, and 100 grammes of gunpowder being introduced into it, it is attached to the machine, the air exhausted, and the remainder of the globe filled with mercury under precisely the same conditions as before; its weight now represents the weight of the globe full of mercury, plus the weight of the gunpowder, and minus the weight of the mercury displaced by the powder. Thus if

S = Specific gravity of mercury at the time of experiment,

W = Weight of globe full of mercury alone, and

W=Weight of globe filled with powder and mercury,

$$\text{Density of the gunpowder} = \frac{S \times 100}{(W-W)+100}$$

Moisture.

The fifth point to ascertain is moisture. The powder must contain a percentage of moisture between limits laid down for each description. The amount of moisture is ascertained by drying a carefully weighed sample in a water oven until there is no further loss of weight; from the weight lost, the percentage of moisture can be calculated.

Firing Proof.

The sixth point to ascertain is firing proof for muzzle velocity and pressure in bore of gun. Each gunpowder is tested with the arm in which it is intended to be used and must give an initial velocity between limits laid down; the velocities are taken with the LeBoulange electric chronograph. The particulars for each nature of powder are given in the table below.

Cannon powders must, in addition, give a pressure in the bore, as measured by crusher gauges inserted in the proof gun, not exceeding a certain amount the square inch. A crusher gauge is a small cylinder of copper half an inch in length and one-twelfth of a square inch in sectional area, which is so placed in a hole in the gun as to be compressed by the violence of the explosion on the gun being discharged. From the amount of compression the amount of pressure per square inch on the interior of the bore can be calculated.

The seventh point to ascertain is if the proportions of the ingredients are correct. This is ascertained by a chemical analysis. See below chemical test of powder.

The eighth point to ascertain is the power of the powder to withstand absorption of moisture. This consists in subjecting dried samples of gunpowder in a box, kept at a uniform temperature, the air inside which is charged with moisture to a known degree, by means of a certain quantity of a saturated solution of saltpetre. The samples are weighed at regular intervals to ascertain the rapidity with which the moisture is absorbed by the powder.

The following table gives the densities and muzzle velocities, &c., for Service (Rifle) Powders:

	Velocity.	Pressure	Density	Hygroscopic Test.	Moisture.	Size of Grain.	Proportion of Grain.
Pebble ² .	Not less	Not	Should	--	Not to	The	The lumps

	than 1540 feet.	exceeding 22 tons.	not be less than 1.75.		contain more than 1.3 nor less than 10 percent.	powder is not to be pressed in individual masses or cubes but granulated from press cake 1½" thick.	to be of fairly uniform size and shape varying in number from 6 to 7 in a lb. They should be cubical with rounded edges.
Pebble.	Not less than 1450 feet.	Not exceeding 20 tons.	Not less than 1.75.	Must not absorb more than 1.0 per cent in 48 hours.	Not more than 1.3 nor less than 1.0 percent.	Must pass through ¾ inch mesh sieve and be retained on a ⅜ inch mesh sieve.	The lumps should be cubical with rounded edges clean and glazed and should number 80 to the lb.
R. L. G. ³	Not less than 1540 feet.	Not exceeding 15 tons.	Not less than 1.70.	Must not absorb more than 2 per cent in 24 hours.	Not less than 1 nor more than 1.2 percent.	Must pass through a 2-mesh sieve and be retained on a 3-mesh sieve.	A portion of the powder not exceeding A part of the whole must pass through the 6-mesh sieve clean and glazed.
R. L. G. ²	Not less than 1380 or more than 1430 feet.	Not exceeding 15 tons.	Not less than 1.65.	Must not absorb more than 1.5 per cent in 24 hours.	Not less than 1.00 nor more than 1.2 per cent.	Must pass through a sieve of 3 meshes to the linear inch and be retained	Same as for R. L. G. ²

	1.0 to 1.1 1.1 to 1.2						not less than 8 parts should be retained on a 20-mesh sieve and one part may be allowed to pass a 20-mesh sieve.
R.F.G.	Must not be less than 1260 nor more than 1290 feet.	--	Must not exceed 1.62 nor be less than 1.58.	Should not absorb more than 2.5 per cent in 24 hours.	--	Must pass a sieve of 12 meshes to the inch and be retained on one of 20 meshes. A small quantity may pass the lower sieve.	The whole must pass a 12-mesh sieve. Out of 16 parts not less than 10 must be retained on a 16-mesh sieve and of the remainder not less than 4 parts must be retained on a 20-mesh sieve.

Chemical Analysis of Gunpowder.

Moisture.—About eighty grains of the crushed powder are weighed in a pair of watch glasses with ground edges so as to fit closely over each other. The watch glass containing the powder without its cover is then placed in a dessiccator over oil of vitriol, and the loss of weight is noted every twenty-four hours until a constant weight is obtained.

Sulphur.—From ten to twelve grains are oxidised completely by digestion at a gentle heat with strong nitric acid and chlorate of potash. The excess of nitric acid is then driven off by evaporation to dryness, and the residue dissolved in water. To the solution chloride of barium is added, and the precipitated sulphate of baryta completely washed by repeated boiling with small quantities of water.

Saltpetre or Nitre.—About eighty grains are treated with boiling water, and the dissolved nitre, after filtration from the sulphur and charcoal, is evaporated to dryness and weighed.

Charcoal.—The quantity of this ingredient is represented by the amount required to make up a hundred parts after deducting the percentage of sulphur and nitre found.

Good powder consists in a hundred parts of the dry powder of seventy five parts of nitre, ten parts of sulphur, and fifteen parts of charcoal. The moisture should be 1.00 per cent. of the powder in its ordinary condition.
